## PAST

August 12, 1981 the largest computer company, IBM introduced the personal computer world. IBM PC or IBM 5150 specification at the factory was not the first personal computer - personal computers began to release long before. The first personal computer appeared in 1973, called the Xerox Alto and had a mouse (and not just the mouse, and a three-button and optical!), A network card and a graphical user interface, which became available to most users after 10, 14 and 17 years respectively. True, Xerox Alto was never entered in the broad market. The first computer available to all comers, was the Altair 8800, and it happened in December 1974. A first full-fledged personal computer became the Apple II, released in June 1977.

# PRESENT

Today's life can hardly be imagined without PC. Processing information at a great distance, to process and organize data has been made possible thanks to the use of personal computers, which are absolutely necessary.

# FUTURE

The computer of the future, first of all, can perceive and process images in real time, that is, the world is perceived as a machine man. For example, it will provide an opportunity to create a safety control systems that analyze their surroundings will be able to predict natural disasters or terrorist attacks.

The main advantage of this system, in contrast to the human observer - no fatigue or loss of vigilance. In addition, high-quality "vision" will enable computers to better interact with the person perceiving them better facial expressions and gestures.
