

EDUCATION IN FUTURE

Education for the future - alternatives and opportunities

- 
- 
- The education system in the future “knowledge society” will be aimed at developing the structures of the digital economy and the formation of a new middle class. Its representatives will receive education throughout their lives, “for the task” and in innovative formats. Universities will turn into intellectual leaders of the technological “revolution”, but in the future they may be supplanted by network providers of educational services.

In the next decade, the next degree of globalization and mass education is expected, which will change the role

- 
- 
- Technological development will lead to lower education costs and the removal of language barriers.
 - By 2030, a “inverted” university can become a typical educational model, in which training is conducted through platforms of mass open online education, and only laboratories, educational projects and live discussions are implemented in the universities themselves.

Future education will also reduce the distance between the employer and the employee, while the educational services market will increase its degree of flexibility and self-regulation.

To implement the education
model of the future, a
developed high-tech
infrastructure will be
required

- 
- 
- Online databases based on BigData technologies will be formed.
 - Over time, there will be exchanges of educational opportunities for joint and individual training, platform-stores of educational content.
 - Mass certification tests to determine the general educational level will gradually lose relevance.
 - They will be replaced by Internet assessment and certification systems, allowing you to get an external validated assessment of the presence of certain competencies and skills.

THANKS FOR WATCHING
