

hello

Today I'm gonna tell you some
information about robots and
artificial brain

Artificial brain in the 90s and early 21st century achieved its greatest success. There are more and more jobs that people leave to robots, such as exploring another planet, defusing bombs, exploring inside a volcano, or just doing boring household chores like cleaning. Today, many factory jobs are performed by industrial robots. This has led to cheaper production of various goods, including cars and electronics.

Artificial intelligence has successfully been used in a wide range of fields including medical diagnosis, stock trading, robot control, scientific discovery and toys. Industrial robots are also used for packaging of manufactured goods, transporting goods around warehouses or hospitals or removing tiny electronic components with great accuracy, speed and reliability.

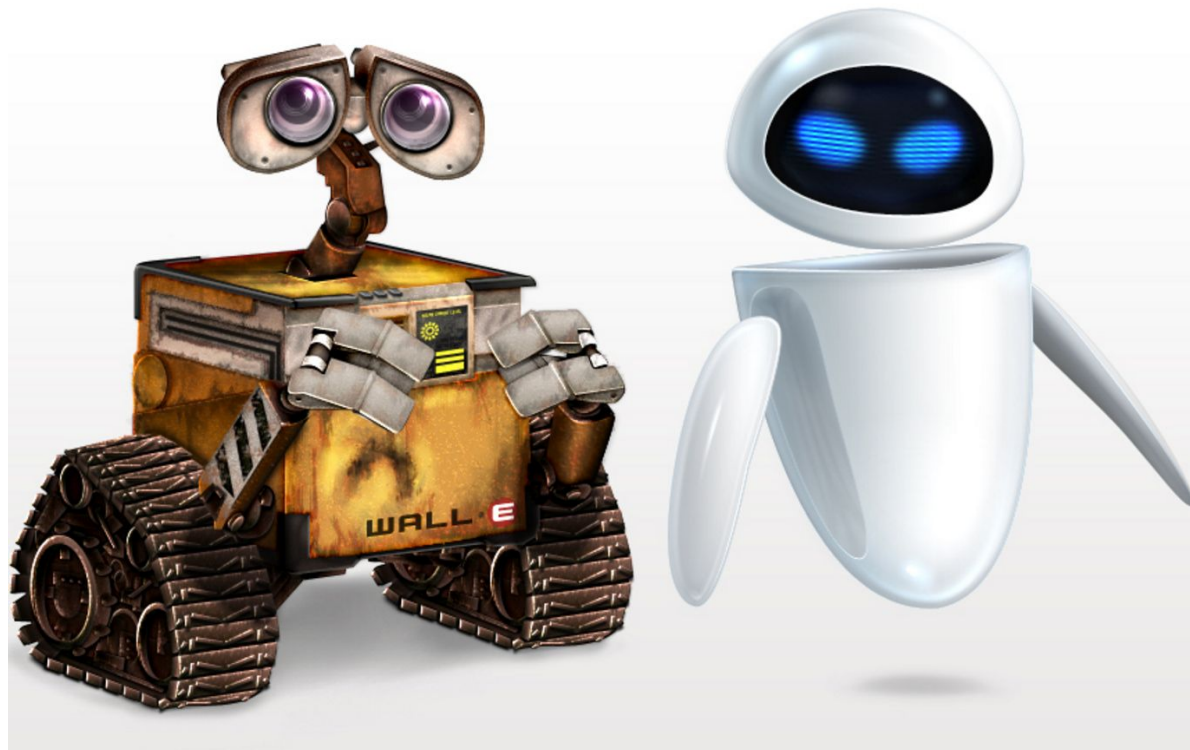

(but, to be honest, you can use robots for just ride your pets on them and no one will judge you)

Are robots our best friends or are they dangerous? Some futurists believe that artificial Intelligence will fundamentally transform society. Other futurists and science fiction writers have predicted that human beings and machines will merge into powerful cyber men with significant mechanical enhancements. Many people fear that highly intelligent robots may take over and destroy the human race.

The use of robots in industrial leads to unemployment as many jobs are performed by machines. Besides industrial robots can be dangerous and cause harm to human workers. So much attention must be paid to security.

The idea of robots is quite interesting. The application of them can do good in different fields in the modern life. In conclusio

eluvetic

um ur cute
ok bye
