LECTURE 9

CALCULUS

Temur Makhkamov

Indira Khadjieva

QM Module Leader

tmakhkamov@wiut.uz

- What is the derivative?

- The derivatives of functions and their use

- Applications of functions to revenue, cost, profit and to the demand and supply theory

Definition: Derivative line is simply a slope of the function. it shows the rate of change of dependent variable resulted from a change of independent variable.
$$f'(x_0) = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} \approx \frac{dy}{dx} \Rightarrow dy \approx f'(x_0)dx$$

Or, simply

$$f'(a) = \lim_{h \to 0} \frac{f(a+h) - f(a)}{h}$$

y

h

x

a+h   a

The slope of Tangent line to the point is derivative of the function.
Tangent means that the line touches the curve at one point only!

For $y = f(x)$, we say that $\lim\limits_{x \to a} f(x) = A$ if the value of $f(x)$ gets closer to A as x gets closer to a.

Examples:

1) $\lim\limits_{x \to 1}(2x) = 2$

2) $\lim\limits_{x \to 2} x^2 = 2^2 = 4$

3) $\lim\limits_{x \to 1} \dfrac{x^2 - 1}{x - 1} = \lim\limits_{x \to 1} \dfrac{(x-1)(x+1)}{x-1} = \lim\limits_{x \to 1}(x+1) = 2$

4) $\lim\limits_{x \to +\infty} \dfrac{x+1}{2x-1} = \lim\limits_{x \to +\infty} \dfrac{x\left(1+\dfrac{1}{x}\right)}{x\left(2-\dfrac{1}{x}\right)} = \lim\limits_{x \to +\infty} \dfrac{1+\dfrac{1}{x}}{2-\dfrac{1}{x}} = \dfrac{1+0}{2-0} = \dfrac{1}{2}$

5) $\lim\limits_{x \to 0} \dfrac{1}{x} = \infty$ (*no limit*)

1) $y = C$ (C – const),

$y' = (C)' = 0$ Ex: $(5)' = 0$; $(-13)' = 0$.

2) $y = ax + b$ (a, b – const),

$y' = (ax + b)' = a$ Ex: $(12x + 3)' = 12$.

3) $y = ax^n$ (a, n – const),

$y' = (ax^n)' = nax^{n-1}$ Ex: $(4x^5)' = 5*4x^{5-1}$

4) $y = a^x$ (a > 0, a ≠ 1),

$y' = (a^x)' = a^x \ln a$ Ex: $(7^x)' = 7^x \ln 7$.

$y' = (e^x)' = e^x$

5) $y = \log_a x$ (a > 0, a ≠ 1),

$y' = (\log_a x)' = 1/(x \ln a)$ Ex: $(\log_4 x)' = 1/(x \ln 4)$

$y' = (\ln x)' = 1/x$

Revenue is the amount of money received by selling products

Cost of production is the amount of money spent to make the products

Quantity demanded is the number of products demanded by customers at the market

Quantity supplied is the number of products delivered to the market for sales

A firm sells pens for $2 each. Hence, the revenue function is

$$R(Q) = 2Q$$

A firm has $150 dollar *fixed cost** and $1.5 *variable costs**. Hence, the cost function is

$$C(Q) = \$1.5Q+150$$

A firm produces books. Books supply and demand depend upon the price. Therefore, the supply and demand function are:

$$Q_D(P) = 100 - 0.5P$$
$$Q_S(P) = 80 + 0.5P$$

Rule of Differentiation (1)

1. The constant rule.

If $f(x) = Cg(x)$ (C is constant),

$$f'(x) = (Cg(x))' = Cg'(x)$$

Ex: For $f(x) = 3x^2$,

$$f'(x) = (3x^2)' = 3(x^2)' = 3(2x) = 6x$$

2. The sum and difference rule.

$$\text{If } f(x) = g(x) \pm h(x),$$

$$f'(x) = (g(x) \pm h(x))' =$$

$$= g'(x) \pm h'(x)$$

Ex: For $f(x) = 3x^3 + x^2,$

$$f'(x) = (3x^3 + x^2)' =$$

$$= (3x^3)' + (x^2)' = 9x^2 + 2x$$

3. The product rule.

If $f(x) = g(x) h(x)$,

$f'(x) = (g(x) h(x))' =$

$= g'(x) h(x) + g(x) h'(x)$

Ex: If $f(x) = xe^x$, then

$f'(x) = [(x)(e^x)]' =$

$(x)'(e^x) + (x)(e^x)' =$

$= e^x + 2xe^x.$

4. The quotient rule.

If $f(x) = \dfrac{g(x)}{h(x)}$.

$$f'(x) = \dfrac{g'(x)h(x) - g(x)h'(x)}{h^2(x)}$$

Ex: If $f(x) = \dfrac{x-1}{x^2}$,

then $f'(x) = \left(\dfrac{x-1}{x^2}\right)' =$

$$= \dfrac{(x-1)'(x^2) - (x-1)(x^2)'}{(x^2)^2} =$$

$$= \dfrac{x^2 - (x-1)2x}{x^4} = \dfrac{-x^2 + 2x}{x^4}$$

5.   The chain rule

if $f(x) = g(h(x))$,

$f´(x) = g´(h(x)) = g´(h(x))*h´(x)$

Example:

$f(x) = g(h(x)) = (2e^x - 1)^2$

Where, $g(x) = x^2$ and $h(x) = (2e^x - 1)$

$f'(x) = [(2e^x - 1)^2]' =$

$= 2(2e^x - 1)*(2e^x - 1)' =$

$= 2(2e^x - 1)*2e^x =$

$= 8e^{2x} - 4e^x$

Today, you learnt

- Definition of derivatives
- Limits and derivation of derivatives
- Derivatives and their usage in real world
