- 1 Look at the Key Words and answer the questions (1–5). Check your answers on page 92.

Key Words: Animals

crocodile dinosaur elephant giant sloth
hamster horse lizard mammoth
rhinoceros sabre-toothed tiger whale wolf

- 1 Which animals don't exist now?
- 2 Which is the biggest?
- 3 Which is the smallest?
- 4 Which animals eat or ate meat?
- 5 Which can you keep as pets?

When dinosaurs dominated the Earth, mammals were small, furry animals, hiding in the forests. After the **disappearance** of the dinosaurs, these creatures evolved into modern mammals. But that isn't the whole story. Between the time of the dinosaurs and our own history, there was another time ...

A TIME THE WORLD FORGOT

1 Fossils found in Germany show the **existence** of mammals about forty-five million years ago. One animal was an early **relation** of the horse but only fifty centimetres tall. **Ambulocetus** was even more amazing; it was a kind of small whale with legs, which probably walked and swam like a crocodile.

2 In this period, birds were much bigger and more dominant than mammals. They probably developed from dinosaurs. **Archaeologists** have found **evidence** of huge birds like the **gastornis**. They were up to three metres tall and couldn't fly. They were meat-eaters – and there were lots of small mammals on the menu!

3 When the Earth's climate got a lot colder, these giant birds died out and mammals took control but there's a big **difference** between these mammals and the ones we know today. The Earth thirty million years ago was a land of giant mammals such as a nine-metre-long rhinoceros and a five-metre-long wolf!

Let's watch a video.

4 The reason for the **extinction** of these giant mammals is a **mystery** but some were alive until quite recently. For example, we know early humans hunted mammoths and **sabre-toothed tigers**. And in the 1830s, Charles Darwin found the bones of a **giant sloth** in Chile which lived 10,000 years ago. It was the size of an elephant and looked like a huge hamster!

5 Is this the complete story of the **evolution** of life on Earth? Probably not. We are discovering new **information** all the time. In 2005, Chinese **scientists** reported the **discovery** of a fossil of great **importance**. This unknown mammal lived about 130 million years ago and was a bit bigger than a cat. Interestingly, it had the bones of a small dinosaur in its stomach. A dinosaur-eating mammal? What will we discover next?!

4 Use the advice in the Reading Help to identify the main point in paragraphs 1–5.

- 1
 - a) Some fossils were found in Germany.
 - b) Small mammals lived forty-five million years ago.
 - c) Some mammals could swim.
- 2
 - a) Huge meat-eating birds dominated at this time.
 - b) Birds evolved from dinosaurs.
 - c) There were a lot of birds that couldn't fly.
- 3
 - a) The world got colder.
 - b) Giant birds died out.
 - c) Giant mammals became dominant.
- 4
 - a) Some giant mammals lived recently.

5 Are the statements true (T), false (F) or is there no information (NI)?

- 1 Archaeologists found fossils near Frankfurt in the 1990s.
- 2 Early horses were smaller than modern horses.
- 3 The ambulocetus was a type of crocodile.
- 4 Mammals dominated the animal kingdom forty-five million years ago.
- 5 Archaeologists have found the teeth of the giant wolf.
- 6 Humans lived at the same time as mammoths.

Reading

3 Read the statements about the Ashfall fossil site in the United States. Read the text and decide if they are correct (C) or incorrect (I).

- The volcano killed all the animals immediately. I
- The animals died because they couldn't eat.
- The bodies of the animals became buried in the ash.
- The position of the animals has changed over time.
- Ashfall has fossils of animals and plant life.
- Scientists have found more examples of horses than any other animal.
- Scientists are continuing to find fossils at Ashfall.
- You can't visit Ashfall during the winter.

Ashfall Fossil Site

- About twelve million years ago, a volcano erupted in southwest Idaho. It spread a thick layer of ash over a very large area. Most of the animals in the area survived the volcano, but as they ate the grass, their lungs began to fill up with the ash. Soon their lungs became badly damaged and they began to die.
- The smaller animals died first and after perhaps three to five weeks, the last of the larger mammals could no longer survive. Their bodies were quickly covered by the ash, which was blowing and moving across the area.
- The bodies were not moved over the years that followed and so the skeletons of these animals were preserved in their final positions. Some of them still have their last meal in their mouth and stomach, and their last steps are preserved in the stone.
- In 1971, Mike Voorhies, a palaeontologist who studies fossil animals with backbones, found the complete skeleton of a rhino in an ancient water hole. It was one of hundreds of skeletons at the Ashfall Fossil Site. These include large mammals, birds, and turtles, as well as seeds of grasses and trees.
- Twelve species of mammals have been found including five species of horse, three species of camel, and three types of dog. The most common species is teleoceros major, a type of rhino. There are so many skeletons of this animal that the main part of Ashfall is called the 'Rhino Barn'.
- Ashfall opened to the public on 1st June 1991. There is a Visitor Centre with information displays and a fossil preparation laboratory. Each summer, visitors can watch palaeontologists at work in the Rhino Barn, which covers a section of the fossil bed. New fossils are left exactly as they were found.
- Ashfall is open between May and October. For days and times, please see the website or call the Visitor Centre. School and tour groups can make advance reservations between 1st April and 20th October.
