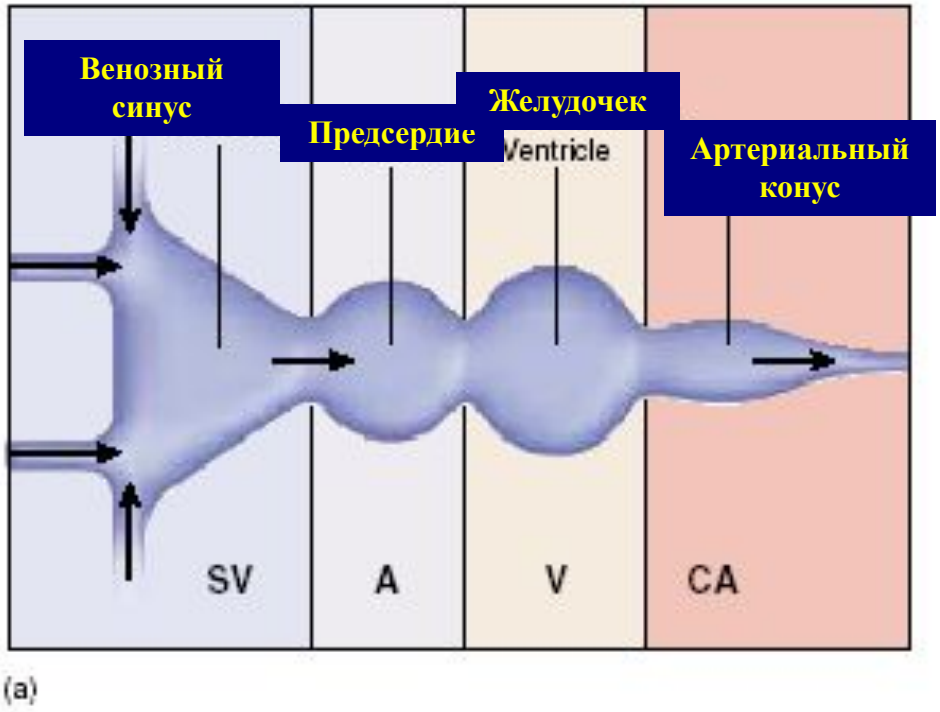
ланцетник

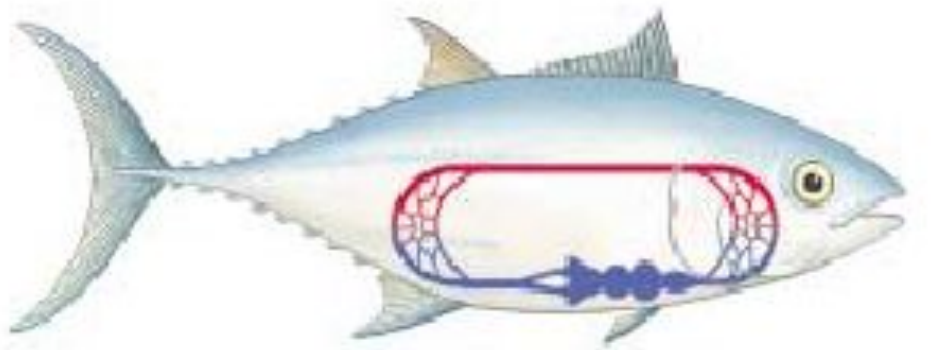
рыбы

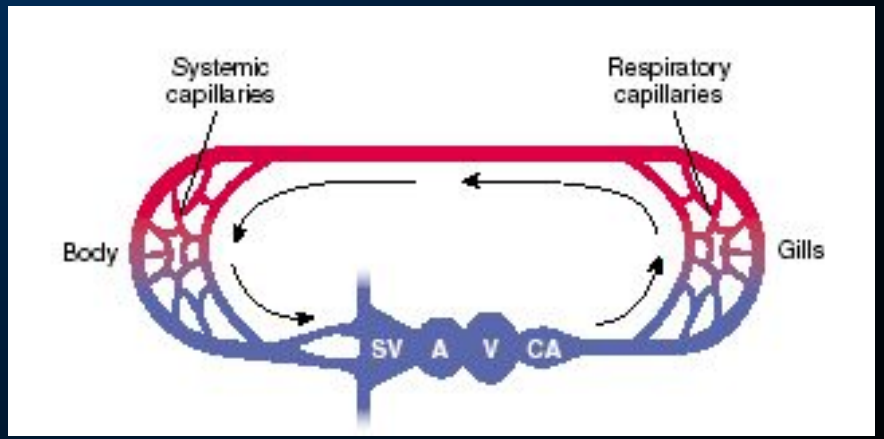
Сердечно-сосудистая система рыб:

1. Замкнутая
2. 1 круг кровообращения
3. 2-х камерное сердце.



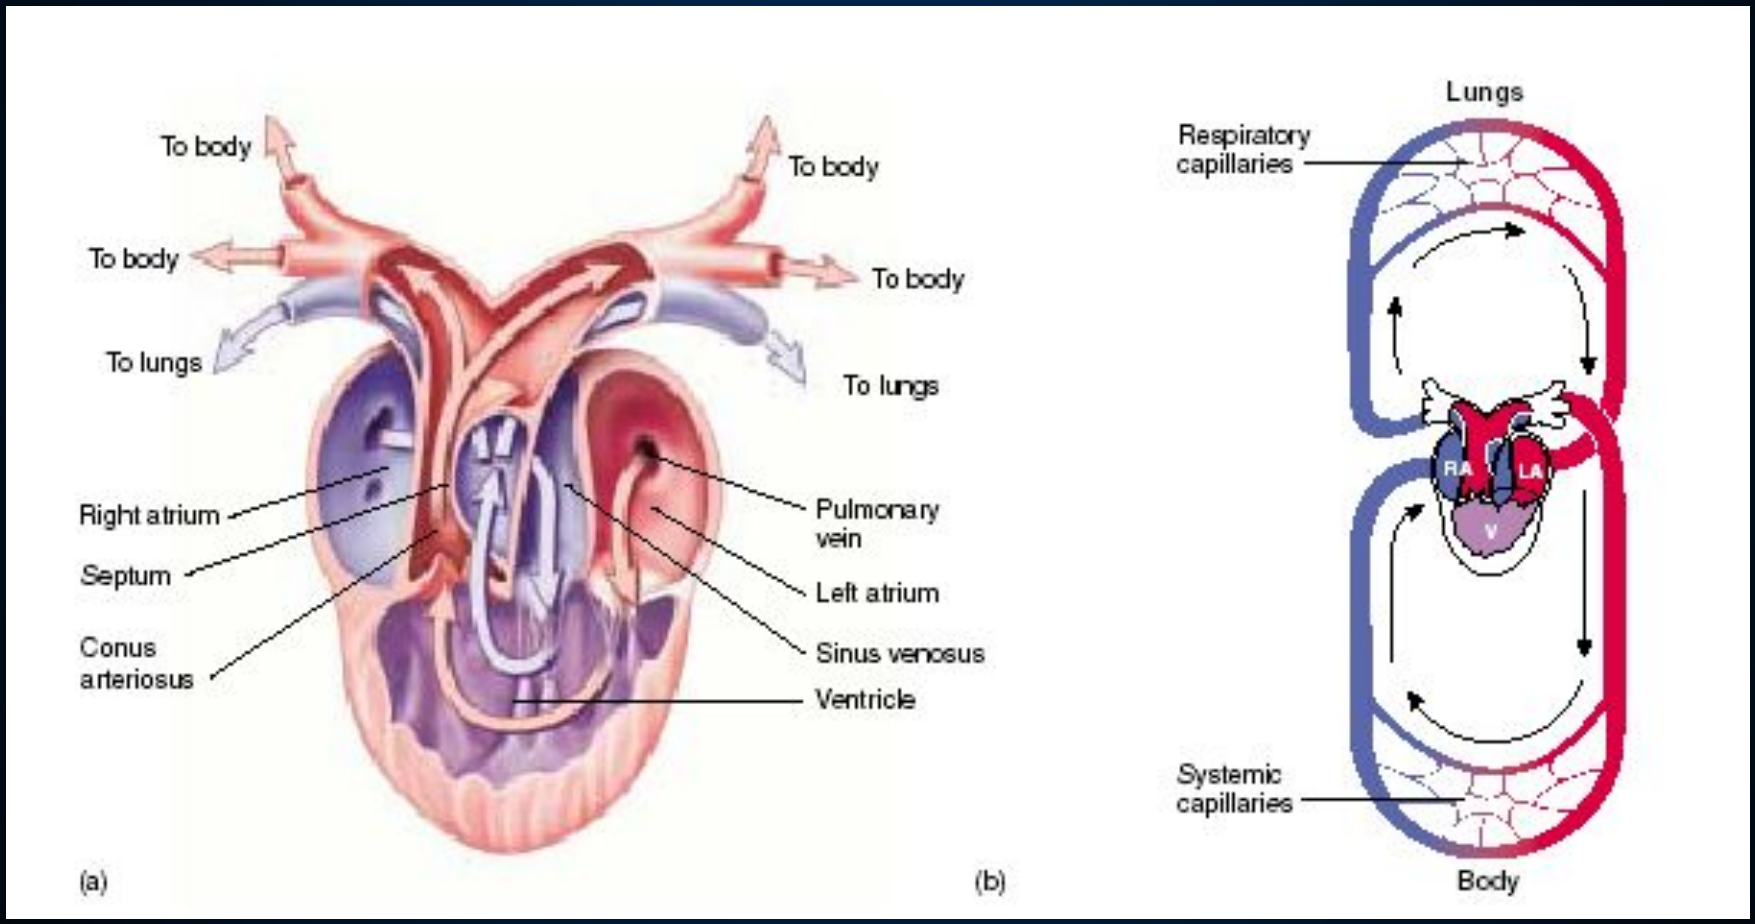
(a)

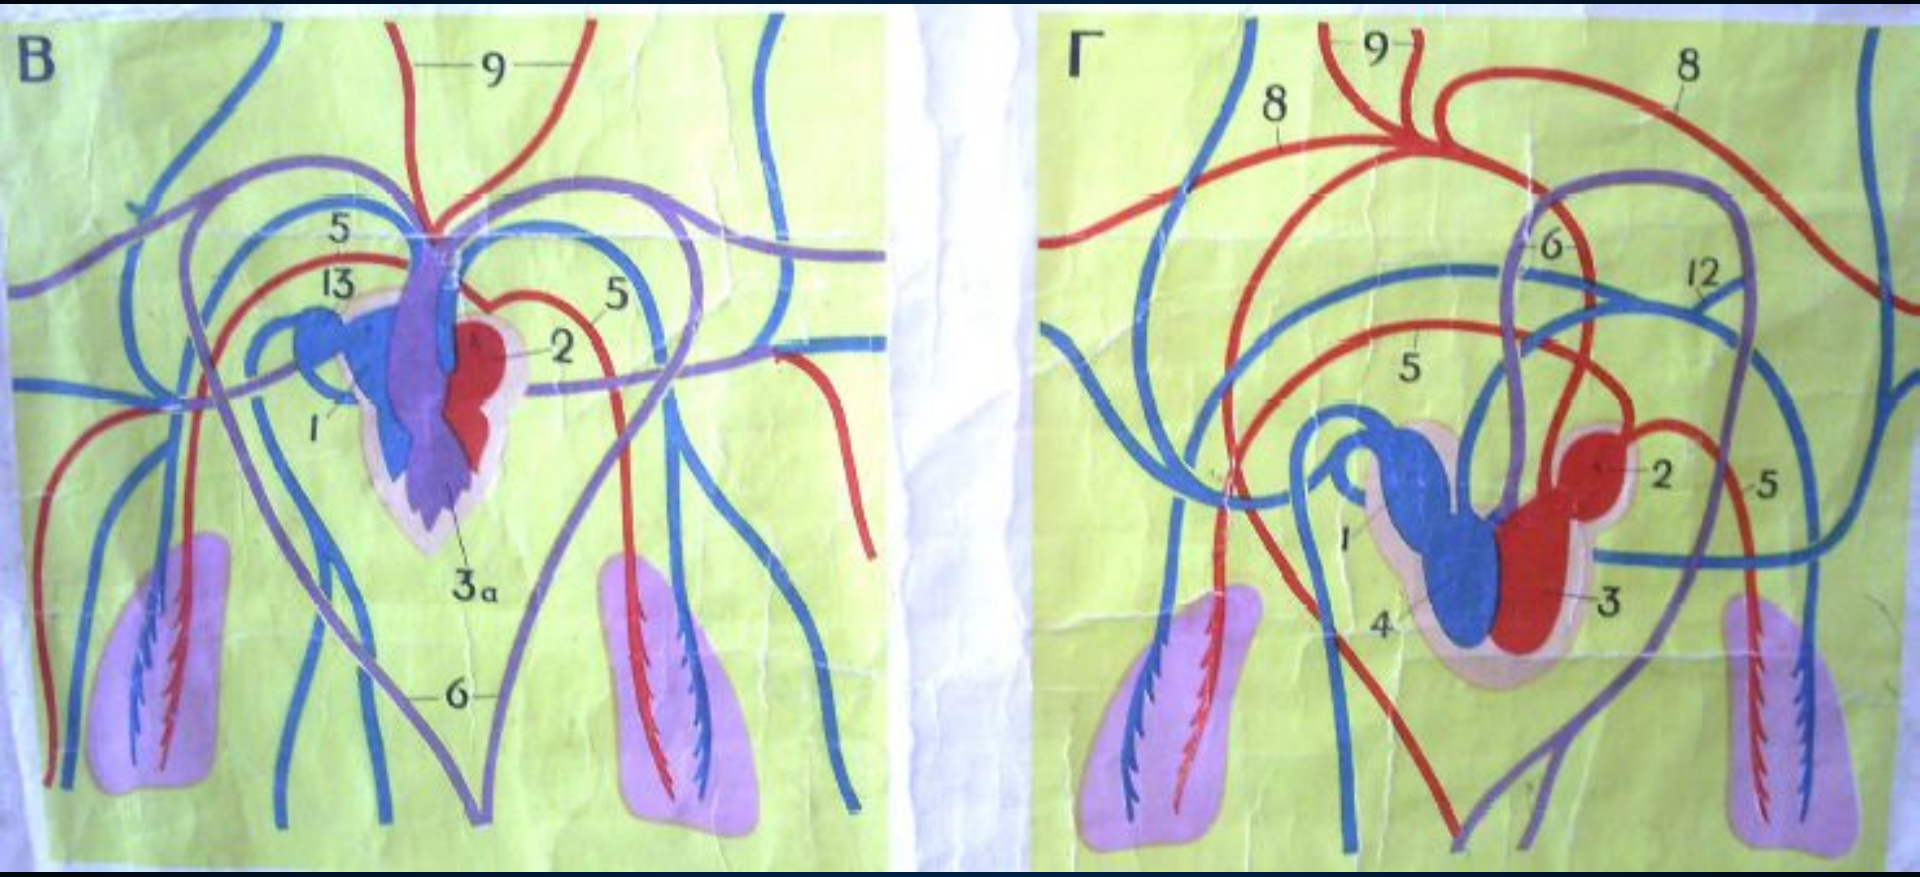




Сердечно-сосудистая система амфибий

2 круга кровообращения, 3-х камерное сердце



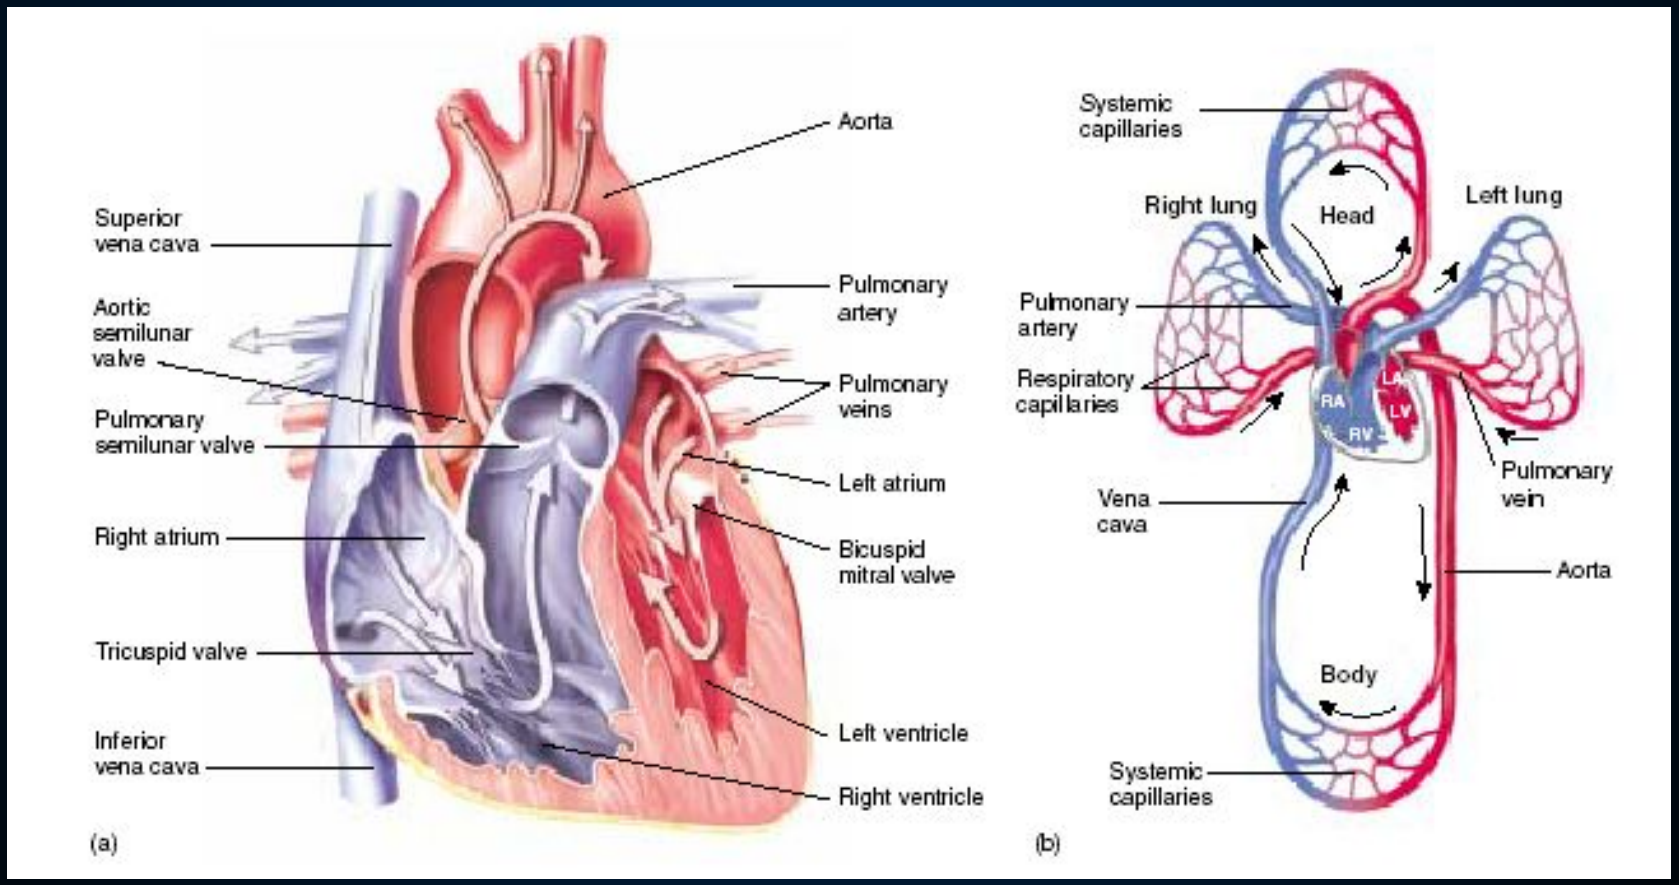


амфибии

пресмыкающиеся

Сердечно-сосудистая система млекопитающих и человека

2 круга кровообращения. 4-х камерное сердце



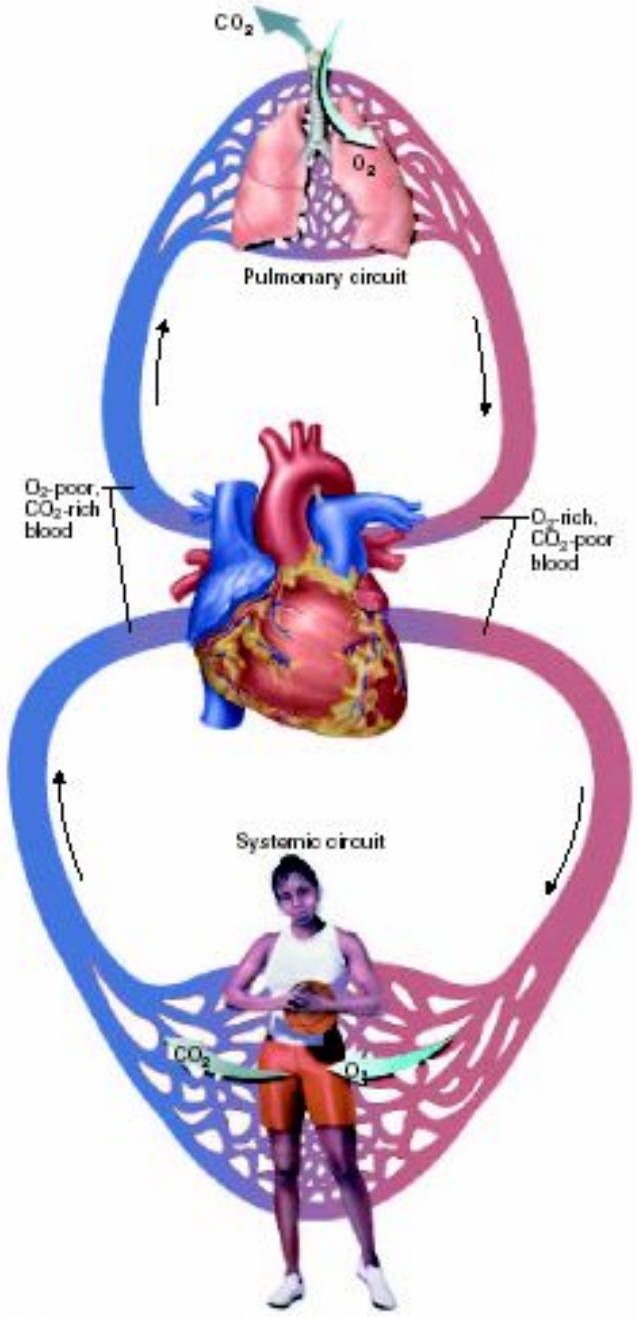


FIGURE 20.1
General Schematic of the Cardiovascular System.

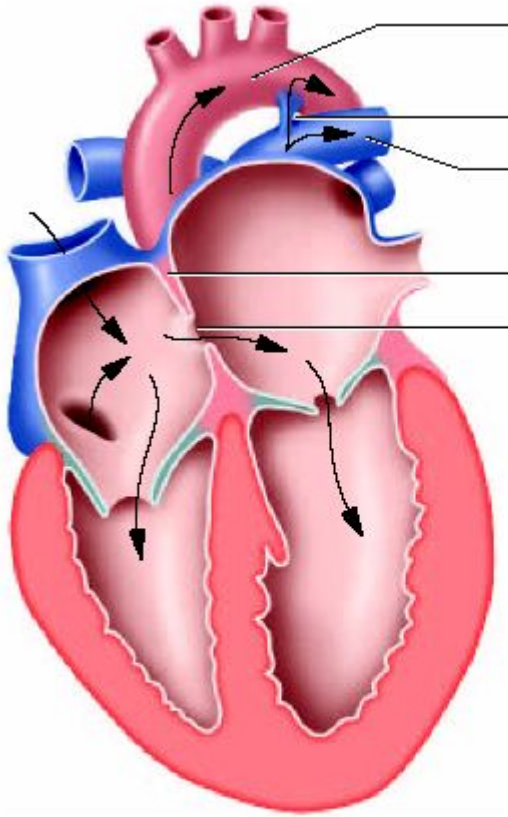

FIGURE 20.16
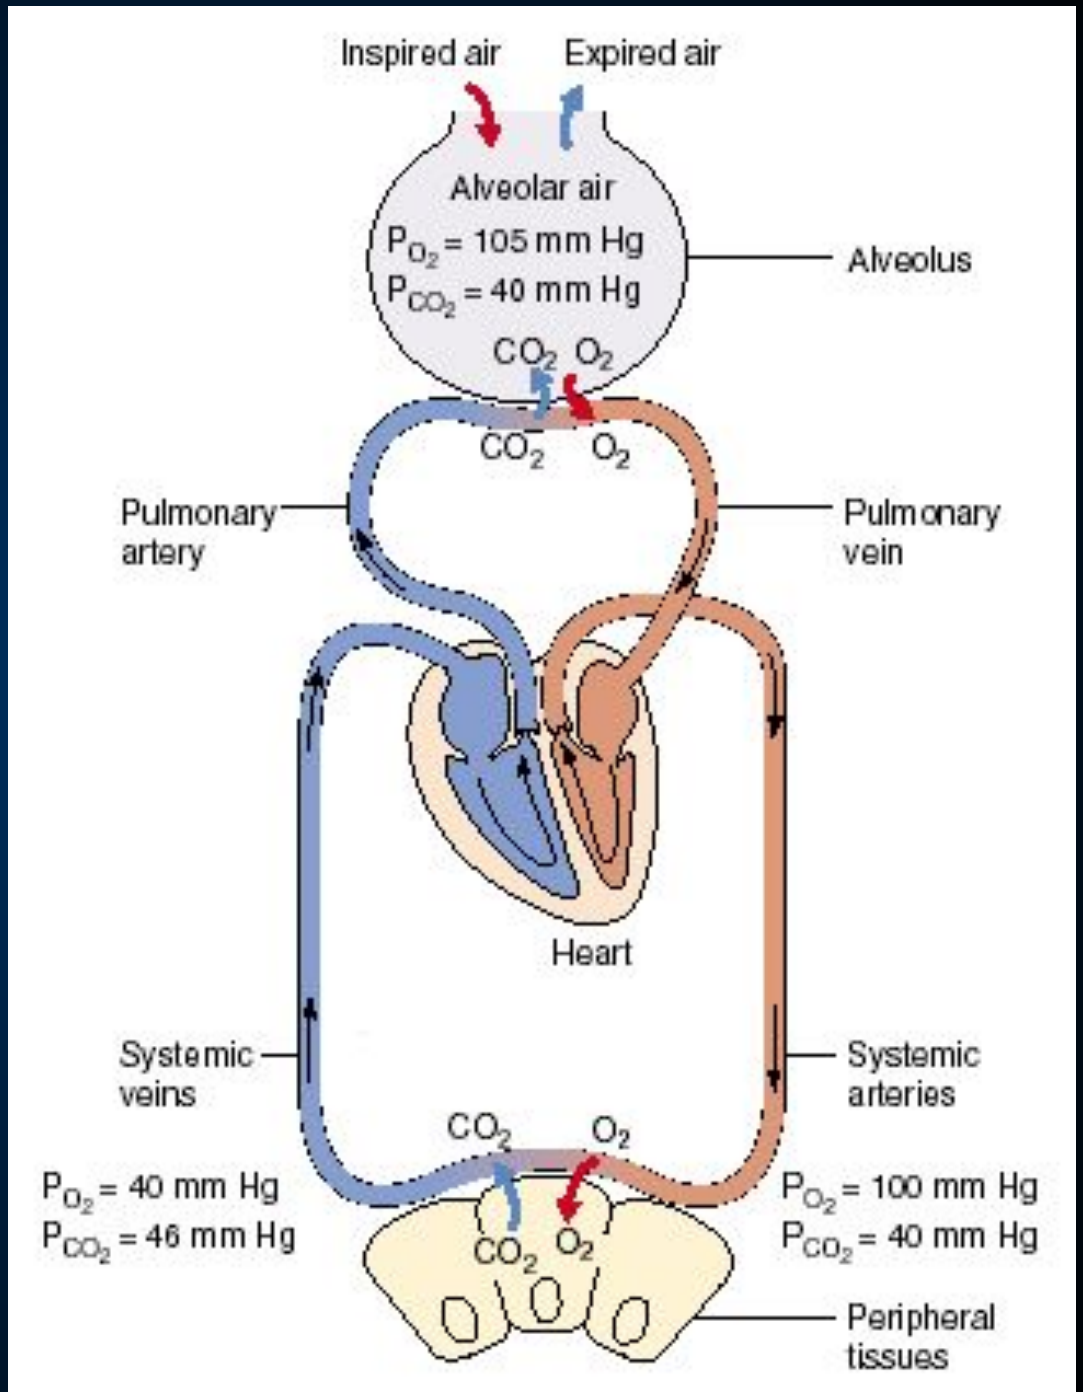
The Fetal Heart. Note the two shunts (foramen ovale and ductus arteriosus) that allow most blood to bypass the nonfunctional lungs.

Полное разделение большого и малого кругов кровообращений – одна из главных предпосылок возникновения теплокровности



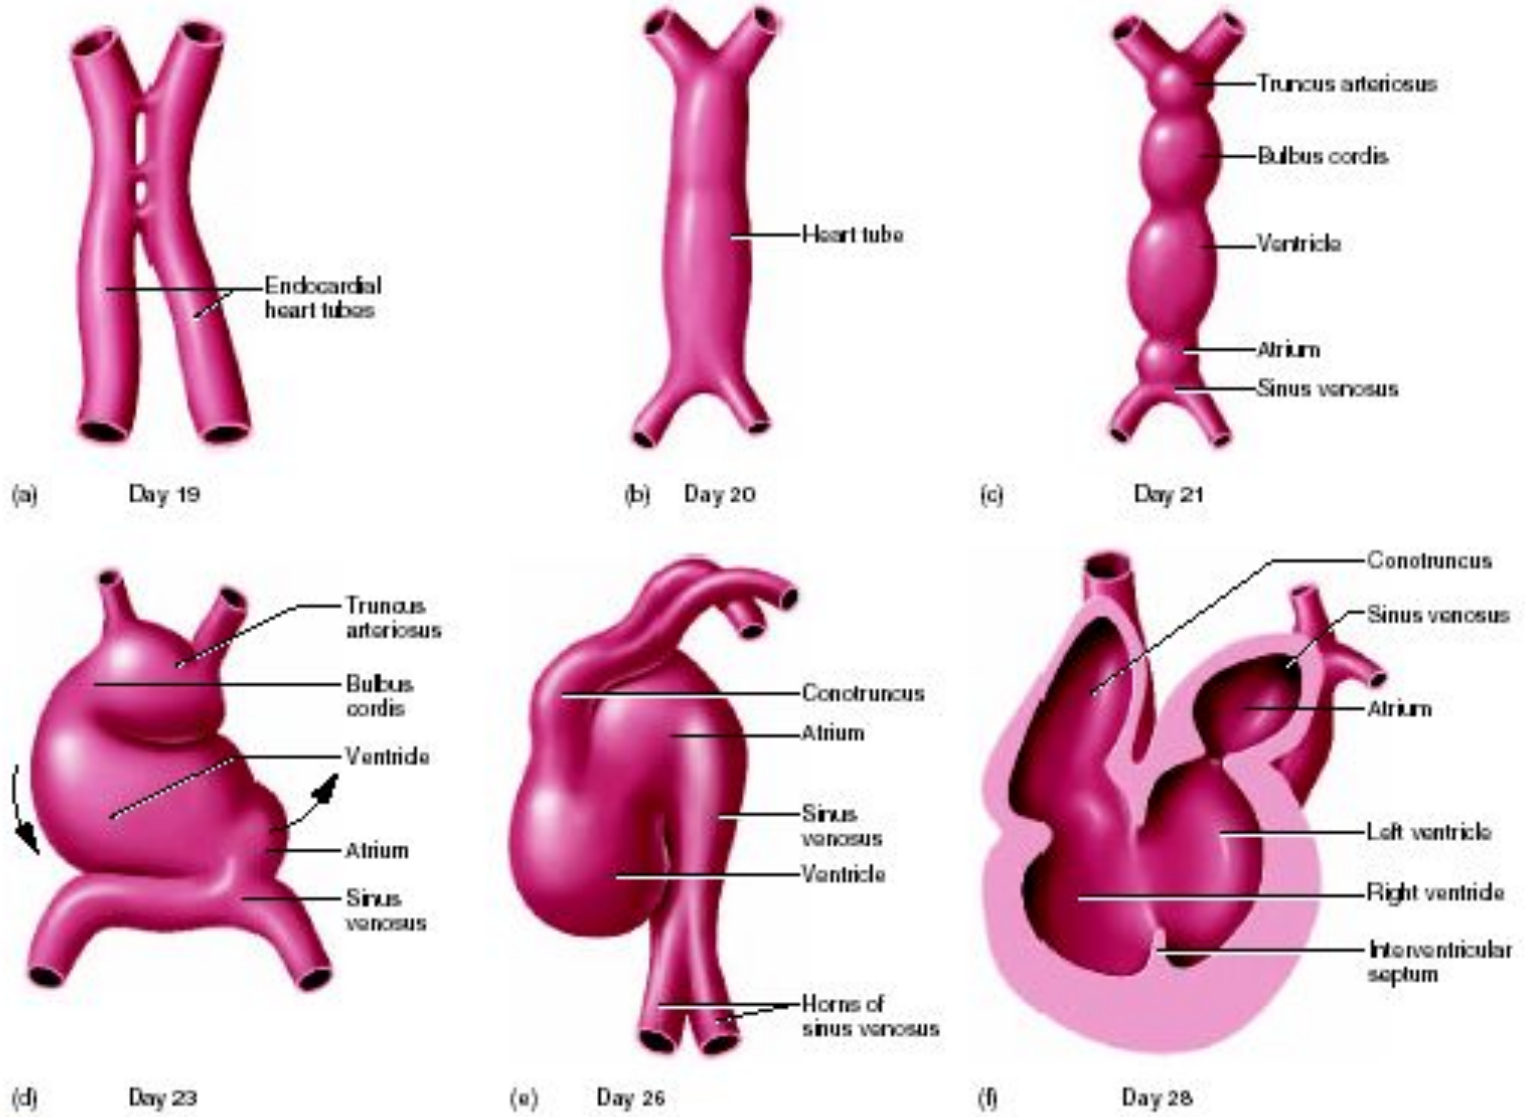


FIGURE 20.15

Embryonic Development of the Heart. (a) The endocardial heart tubes beginning to fuse at day 19. (b) Complete fusion by day 20, forming the heart tube. (c) Division of the heart tube into five dilated segments by day 21. The heart begins beating about a day later. (d) The heart begins looping around day 23, with the bulbus cordis migrating caudally *(left arrow)* and the atrium and sinus venosus migrating rostrally *(right arrow)*. Blood circulates throughout the embryo within a day of this stage. (e) Looping is nearly completed by day 26. (f) Frontal section of the heart at 28 days. As the interventricular septum develops, the conotruncus will divide longitudinally into the ascending aorta and pulmonary trunk, receiving blood from the left and right ventricles, respectively. The single atrium seen here divides into the right and left atria by day 33.

Major calyx
(b)

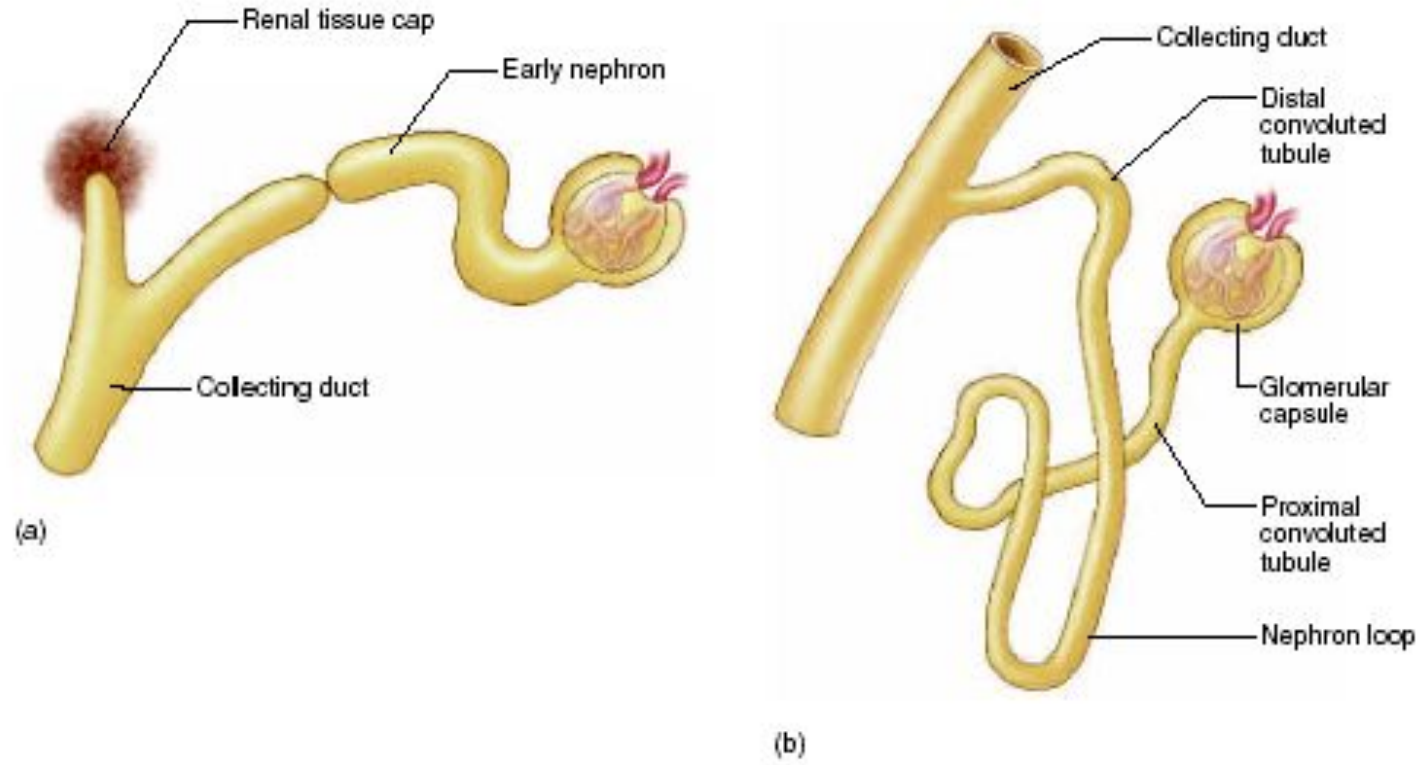

FIGURE 25.12

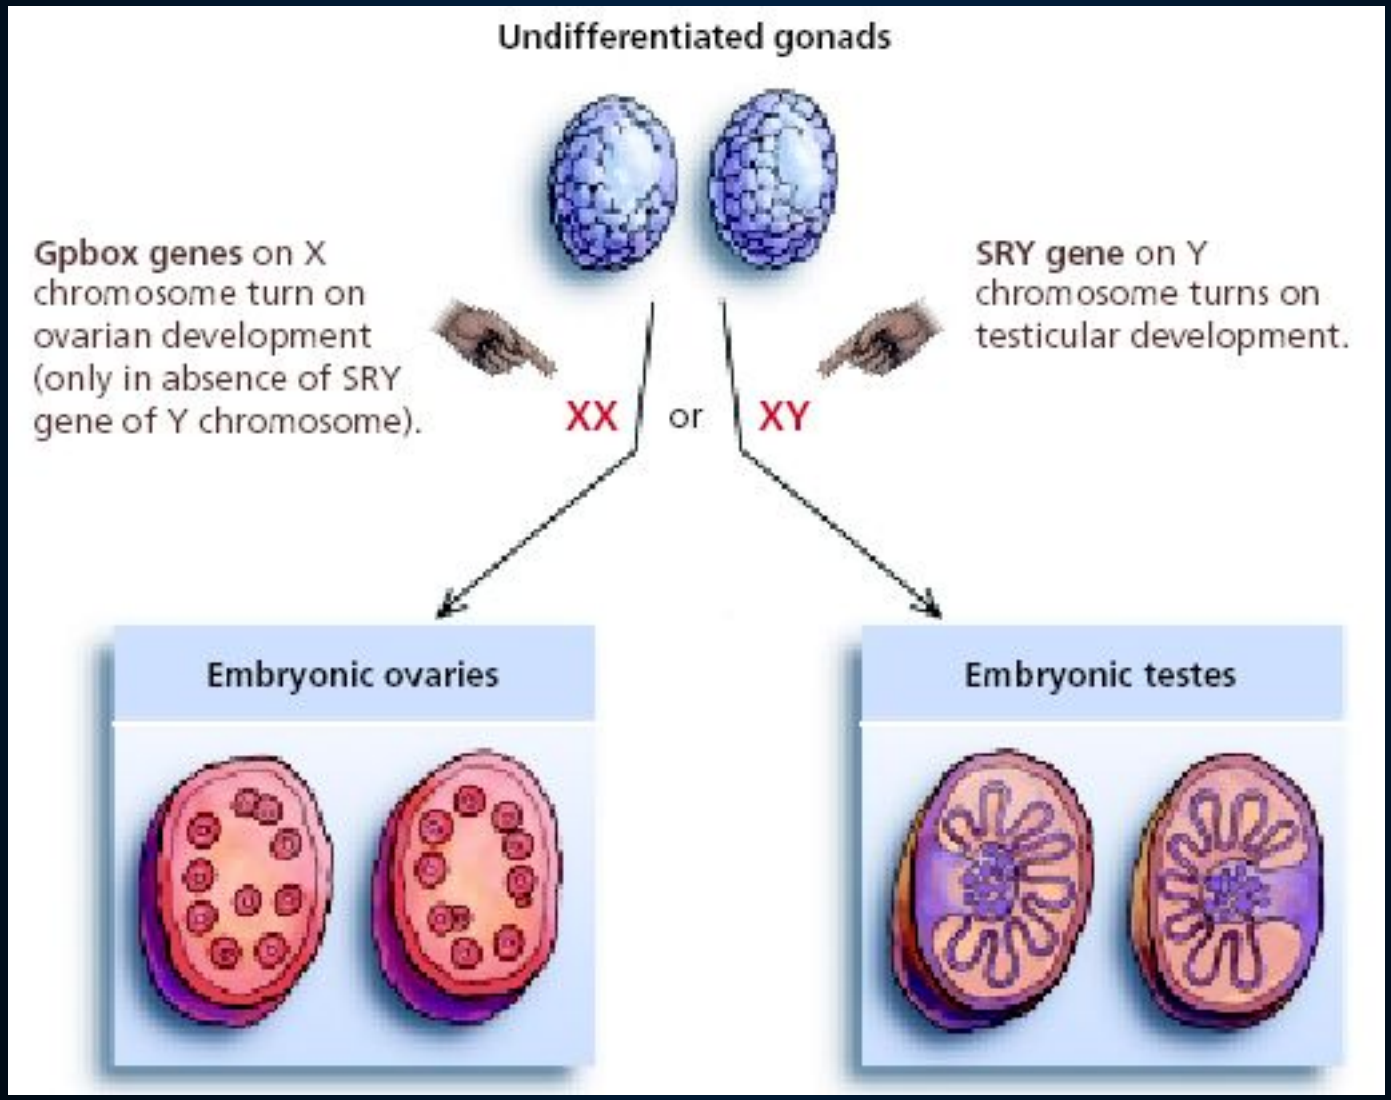
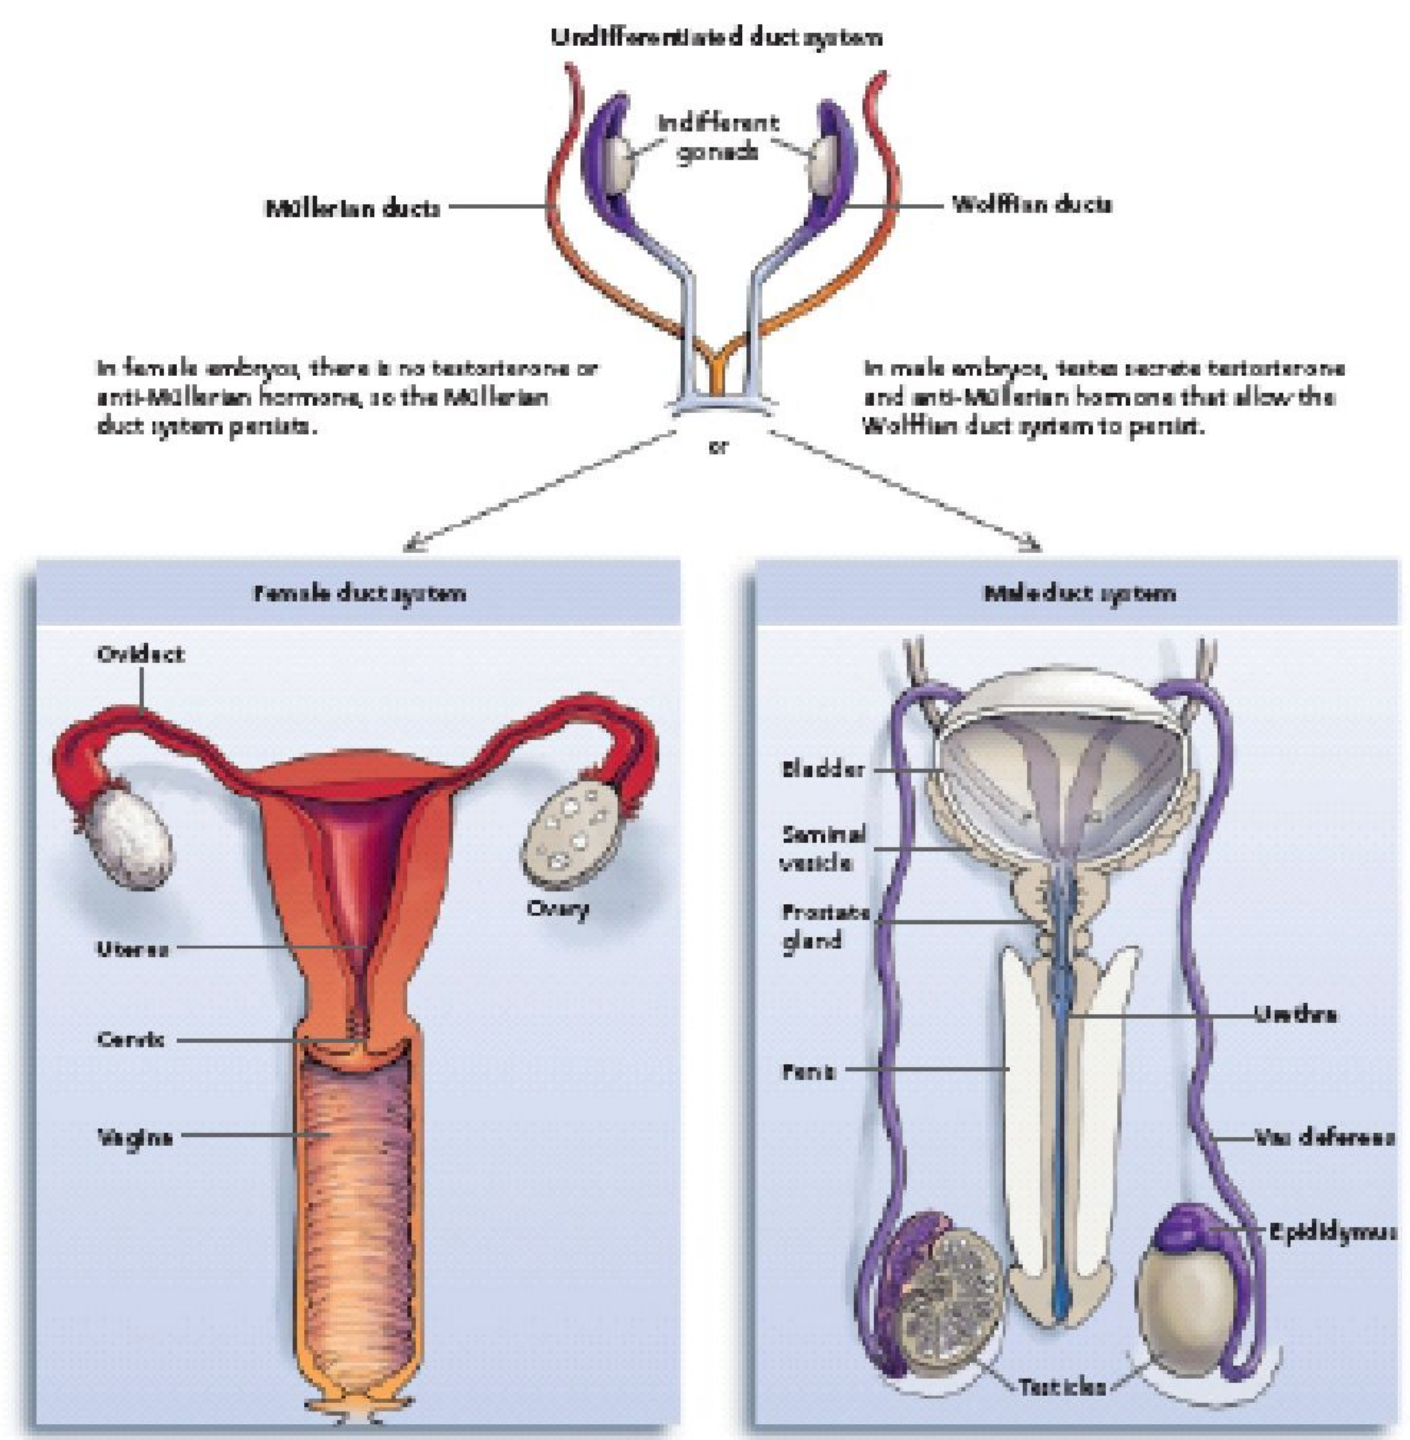
Embryonic Development of the Nephron. (*a*) The collecting duct induces mesoderm to differentiate into a renal (metanephric) tissue cap, as shown at the *far left*. This cap differentiates into an S-shaped tube that will become the nephron, as shown on the *right fork* of the duct (representing a later stage of development). (*b*) The renal tubule has begun to differentiate into proximal and distal convoluted tubules and nephron loop.

Филогенез половой системы хордовых





Undifferentiated duct system
Indifferent gonads
Müllerian ducts
Wolffian ducts
In female embryos, there is no testosterone or anti-Müllerian hormone, so the Müllerian duct system persists.
In male embryos, testes secrete testosterone and anti-Müllerian hormone that allow the Wolffian duct system to persist.
