

WASHING MACHINE AS AN INVENTION OF MANKING

Washing machine inventor

Primitive washing machines were a wooden box with a movable frame. The first washing machine launched into mass production was created in 1907 [source not specified 197 days] William Blackstone, she had a manual drive, there is also an opinion that Nathaniel Briggs made the first one

What is the washing machine designed for?

Washing machines are designed for mechanization and automation of one of the most labor-intensive manual labor operations in the household - laundry. The essence of the washing process is the physico-chemical and mechanical action of a detergent solution on the laundry, which consists of two components: water and detergent (detergent)

What is the use of a washing machine

A washing machine is a technique that is difficult to do without in any home. It is not needed only by those who still like to wash by hand. Such devices can not only wash, but also rinse and wring clothes. They have a very simple principle of operation, because all you have to do is throw dirty clothes into them, fill in the washing powder and choose the right program for washing. After completing the process, pick up clean and semi-dry things and go to rest.
