PROJECT AREA presentation

Guya Bertelli, 14th september 2020

CULTURAL BACKGROUND

Key words:

architecture
urban design
landscape

the core of the studio is the **PROJECT** intended as a
THEORETICAL AND PRACTICAL PATH oriented to a specific theme of **DESIGN** in the
CONTEMPORARY FRAGILE LANDSCAPES

RESILIENT LANDSCAPES INFRASTRUCTURES AND PUBLIC SPACES

Within a complex urban reality and its large landscape and territorial potentials, «using» the occasion of 2026 Olympic Games, the Studio will work on the main goals consisting in the

construction of an architectural and urban resilient system,
able to react at the fragile and critic contemporary conditions

- » The project is intended as a multifunctional organism;
- » Focused on the relationship between construction (structure) and composition (figure);
- » It is Interpreted according to the different frameworks of forms, materials, uses and connections;
- » It is Integrated among open, relational and built-up spaces.

The project area: Milano, Porta Romana

RELATIONSHIPS**
SEQUENCE OF THRESHOLDS AND PROJECT
AREAS

Milan PROJECT AREA: Porta Romana railway yard

Background: Milan today
– 1/25000

The site of the intervention is defined by the Porta Romana railway station, an urban 'gap' that today we can read simultaneously in two ways:

1. As an extended **void** recognizable in relationship with the surroundings, which we can interpret, as a 'place' in a state of abandonment and awaiting new transformation;
2. An 'internal' **limit** between the most consolidated part of the city to the north and the peri-urban part to the south, corresponding to what was once the first suburbs.

Both of these conditions make us recognize this place as a significant '**threshold**' of the city, no longer as punctual as the ancient 'gate', but as an 'extended threshold', a dilated limit capable of expressing itself as a potential place for future modification .

STRUCTURE

- Railway
- Road
- Water system
- Green belt
- Built area

Project Area: railway yard at the Porta Romana (Roman gate)

As it appears in the image, the intervention area is located in a strategic point of the city, at the crossroad between the radial Corso di Porta Romana, the ancient 'decuman', and the external ring way, one of the main roads of the city's structural system.

It is a place of interference and encounter between the dense and consolidated fabric of the 'central' city and the more heterogeneous and rarefied settlement of the Modern city (20th century). Here the 'resistant' axes of the urban structure meet with the traces of the surviving agricultural systems, which in the south appear again as an integral part of the settlement system

The rail yard of Porta Romana in the system of the main urban connections

Bird's-eye view: the image shows the relationship between the project area and the city's radiocentric structural system and highlights, according to the south-east / north-west axis, the sequence of recognizable and remarkable places: the railway yard , the Porta Romana gate, the Cathedral, the Sforzesco Castle, the Sempione arch and City life.

Porta Romana freight rail way: map of the local connections

The image shows the system of the three large implants existing in the quadrant taken into consideration:

- 1- The yard of Porta Romana, 20th century, crossed by the route of the railway line, with a passing station
- 2- The Porta Vittoria yard at North/east sector, 20th century, with 'head' station
- 3- The basin of Darsena and the Navigli, XIII century, landing in the city of the Milanese canal system

Sequences of sections: intervals, measures and rhythms

The project area therefore presents itself as an extended longitudinal interval, on which different transversal urban 'sections' interfere in sequence, working on specific intervention scales, from the territorial one to the more urban and local one. These sections rhythm the void crossing the railway yard by defining as many intervals and settlement measures, which become important matrices for the configuration of the project system

*A look to the
past*

Umberto Boccioni (1882-1916)

Officine a Porta Romana (1907) /Manufacturing at Porta Romana [Gallerie d'Italia. Gallerie d'Italia di Piazza della Scala](#)

In this painting the city, with its commercial and industrial growth, with its evolution in a modern metropolis and with its suburbs, represents a determining factor that preludes to the subsequent futurist poetics.
