# Основные этапы возникновения адаптивного иммунитета

# РАЗНОВИДНОСТИ ЛИМФОИДНЫХ ОРГАНОВ ПОЗВОНОЧНЫХ

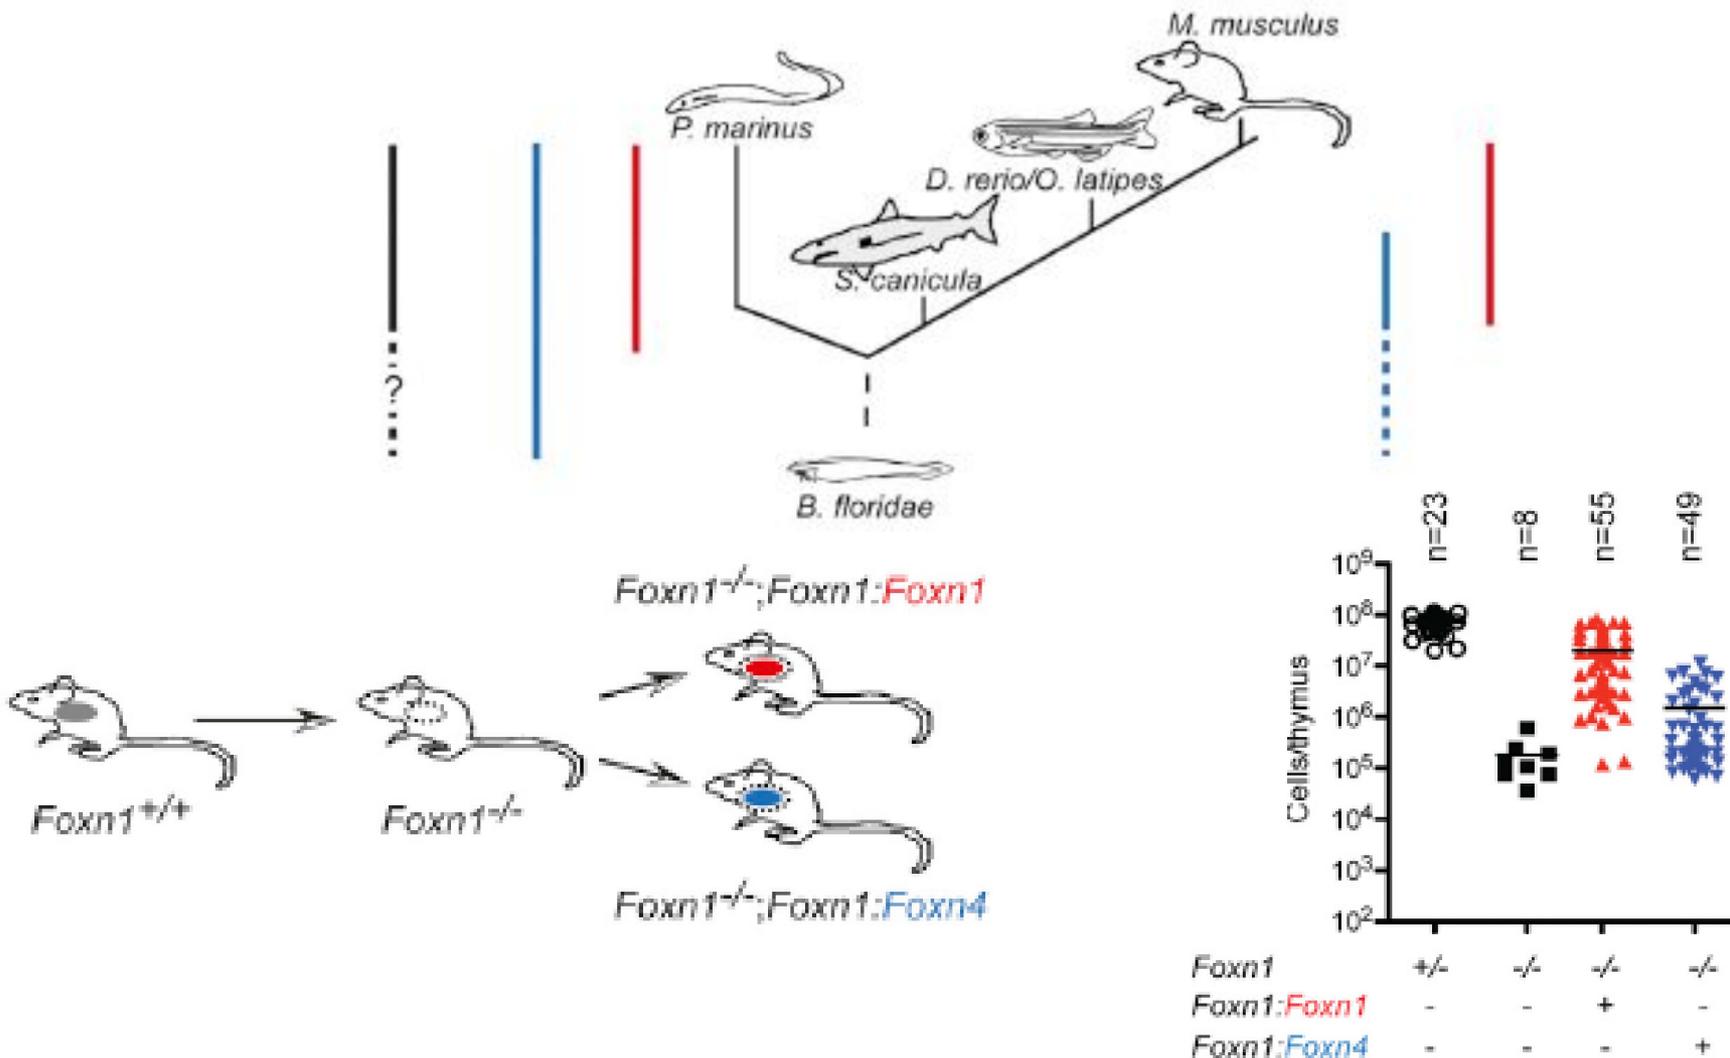

Тип органов	Название органов	Функция
Первичные	Костный мозг, тимус, Фабрициева сумка (у птиц)	Развитие клеток
Вторичные: Инкапсулированные	Лимфоузлы, селезенка, пейеровы бляшки	Индукция (частично реализация) ответа
Неинкапсулированные	Миндалины, лимфоидные фолликулы, криптотатчи	
Диффузная лим- фоидная ткань	Слизистых оболочек, кожи, нелимфоидных органов	Реализация иммунного ответа

# Дифференцировка лимфоцитов в тимусе может определяться одним единственным мастер-геном

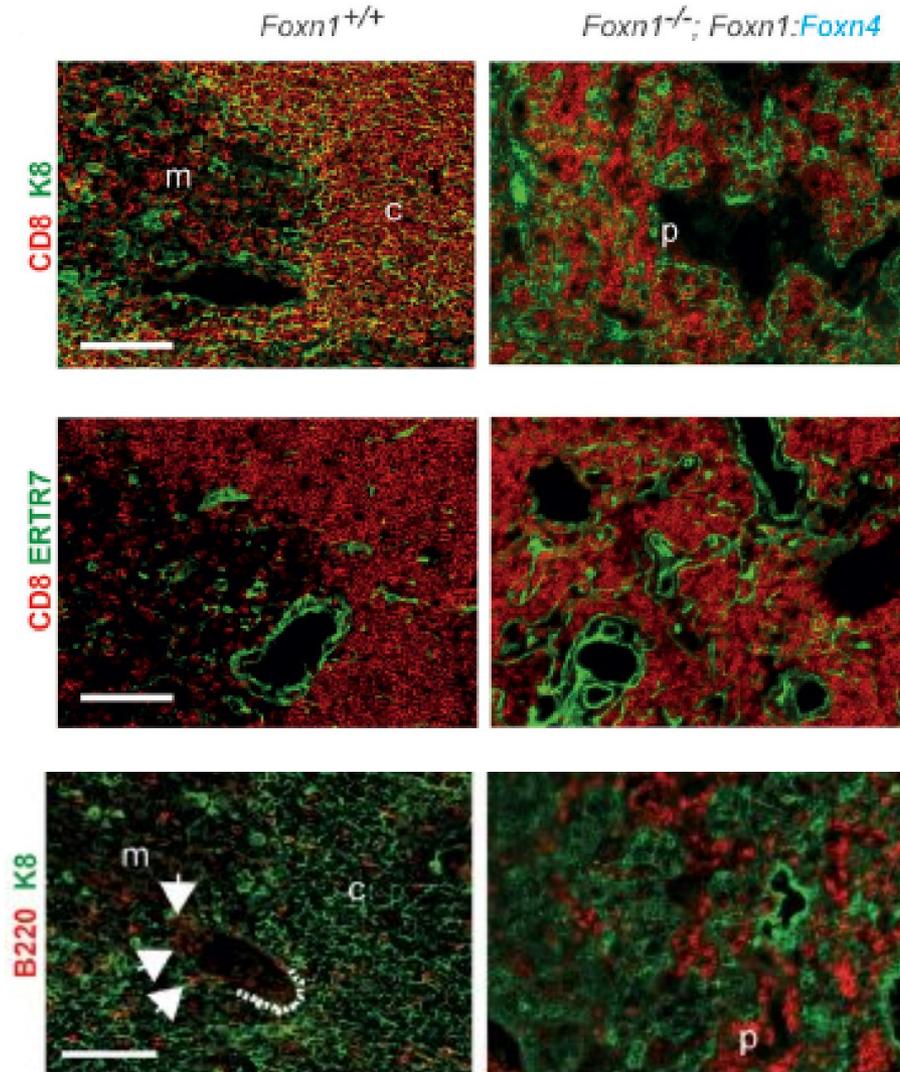

Thymus Gene content Phylogenetic tree Expression in TECs

*Foxn4* *Foxn1*

*Foxn4* *Foxn1*

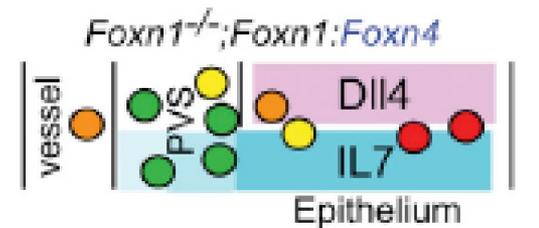

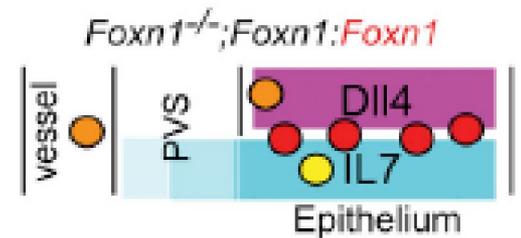

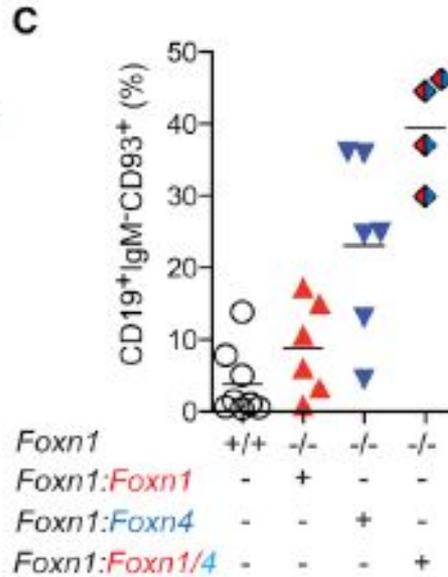

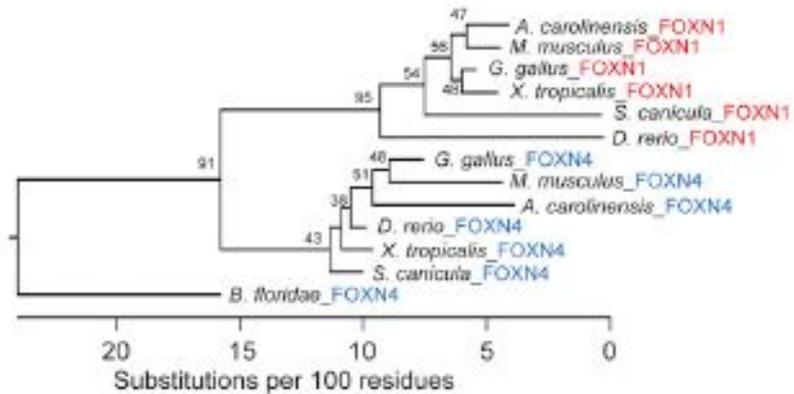

# Замена гена *Foxn1* на его паралог *Foxn4* приглашает В-клетки в тимус

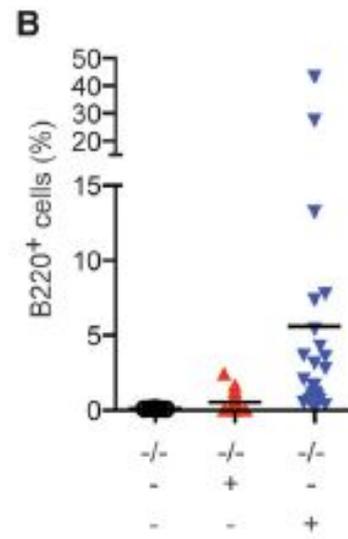

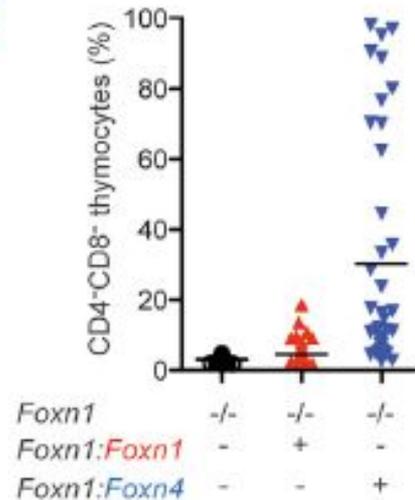

(Swann, et al 2014)

# У мышей с заменой *foxn1* на *foxn4* наблюдается созревание В-клеток в тимусе

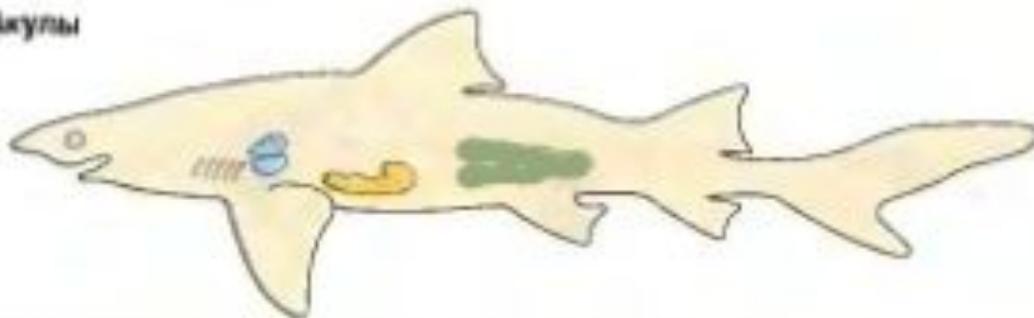

- Orange circle: Lymphoid progenitor
- Green circle: immature B cell
- Yellow circle: mature B cell
- Red circle: T cell

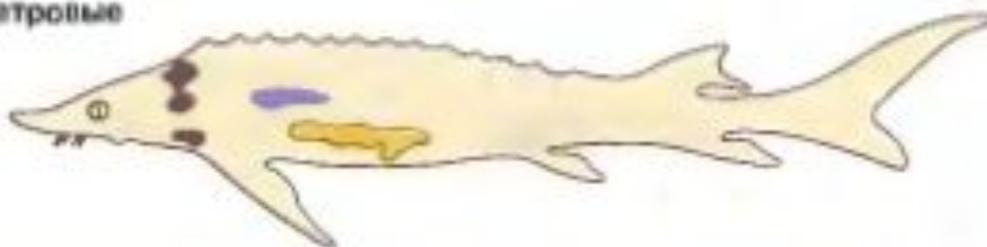

## Лимфомиелоидные ткани у различных групп рыб

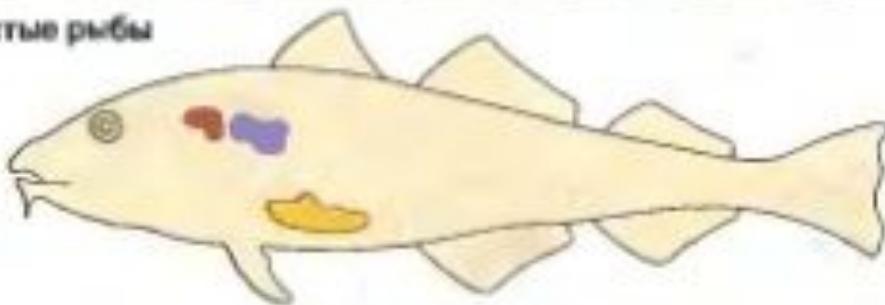

Акулы

Осетровые

Костистые рыбы

# Ультраструктура органа Лейдига схожа со структурой костного мозга млекопитающих

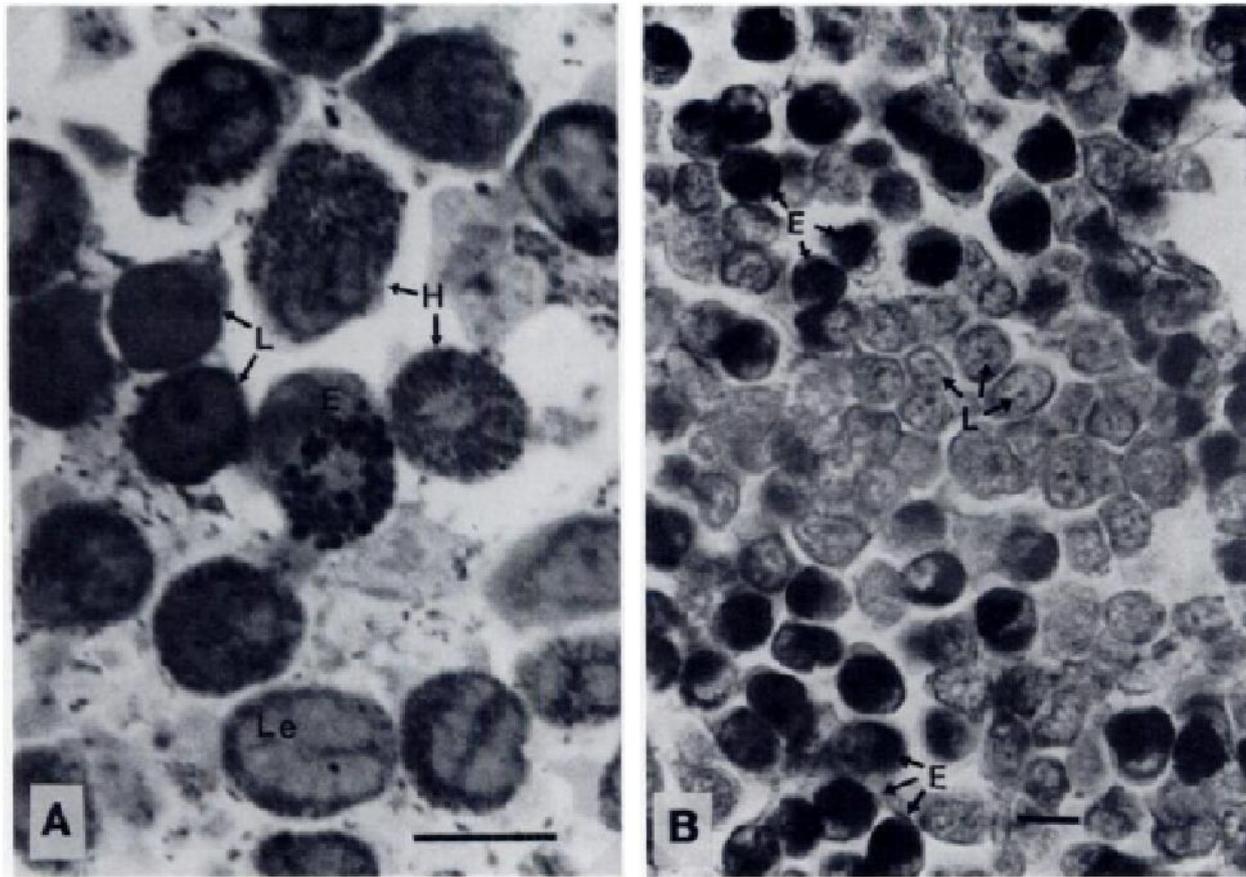

FIGURE 2. Light microscopy of the Leydig organ of *Etmopterus*.

(A): Epon-embedded section, about 1  $\mu\text{m}$  thick and stained with toluidine blue. In the middle an eosinophilic granulocyte (E). Lymphocytes (L) and heterophilic granulocytes (H) are seen around the eosinophilic cell. At the bottom a typical leptomeric cell (Le) with invaginated nucleus. Oil immersion. Bar = 10  $\mu\text{m}$ .

(B): Azan-stained paraffin section. In the middle of the figure a group of non-granulated cells, mainly lymphocytes. Above and below these cells there are eosinophilic granulocytes (dark cells). Bar = 10  $\mu\text{m}$ .

# Клетки органа Лейдига

- А – гранулоциты с дольчатым ядром,
- В – лимфоцит, справа от него – эозинофил
- С – Две плазматические клетки
- Д – Малые лимфоциты и гранулоцит
- Е – Гетерофильный гранулоцит

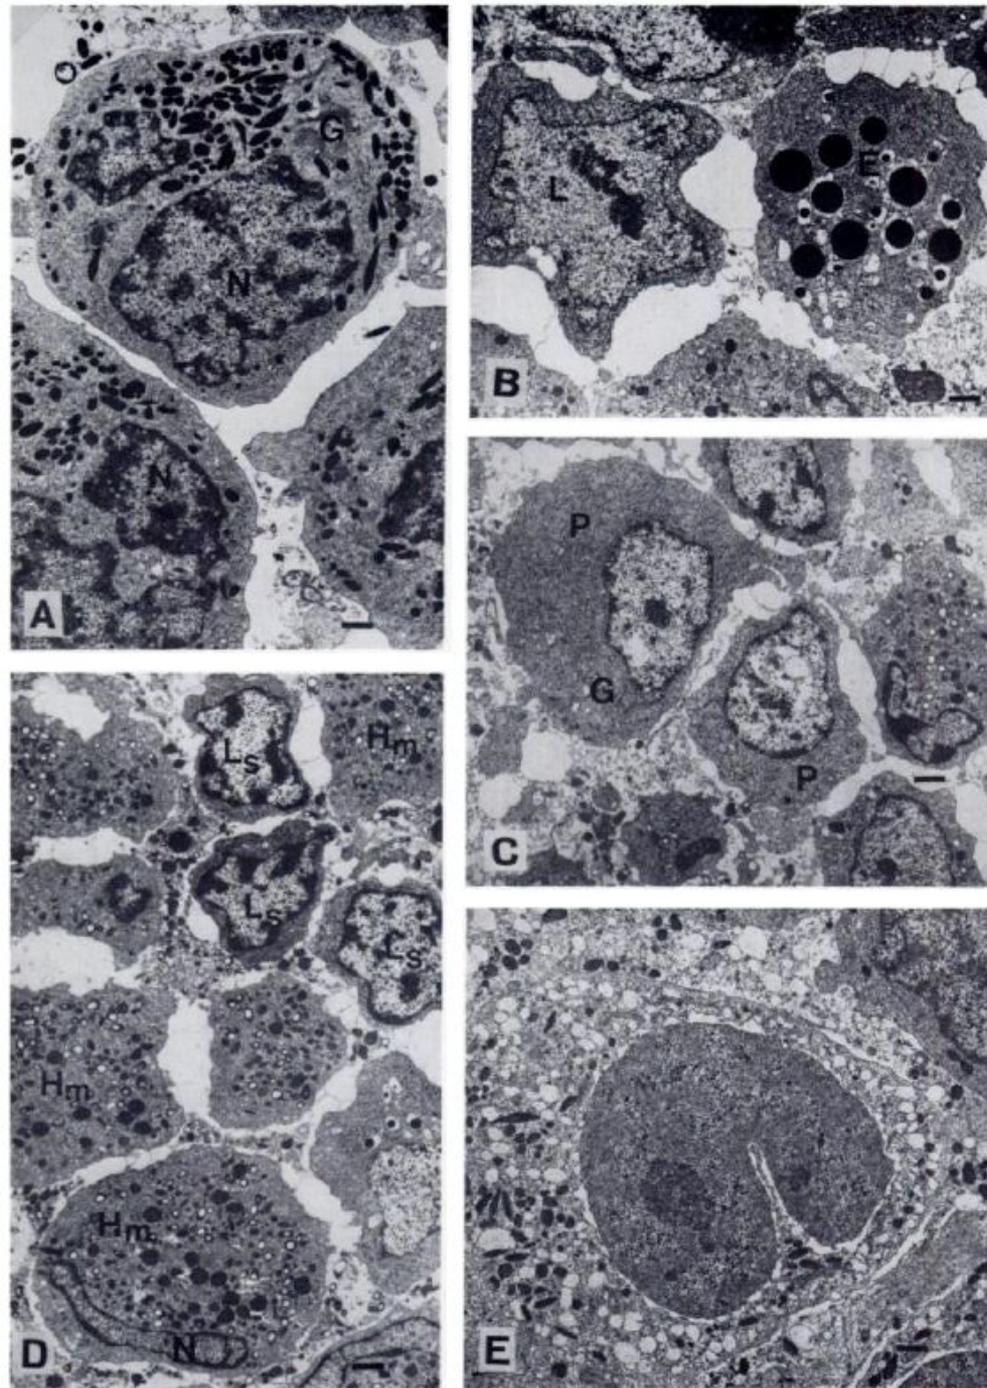

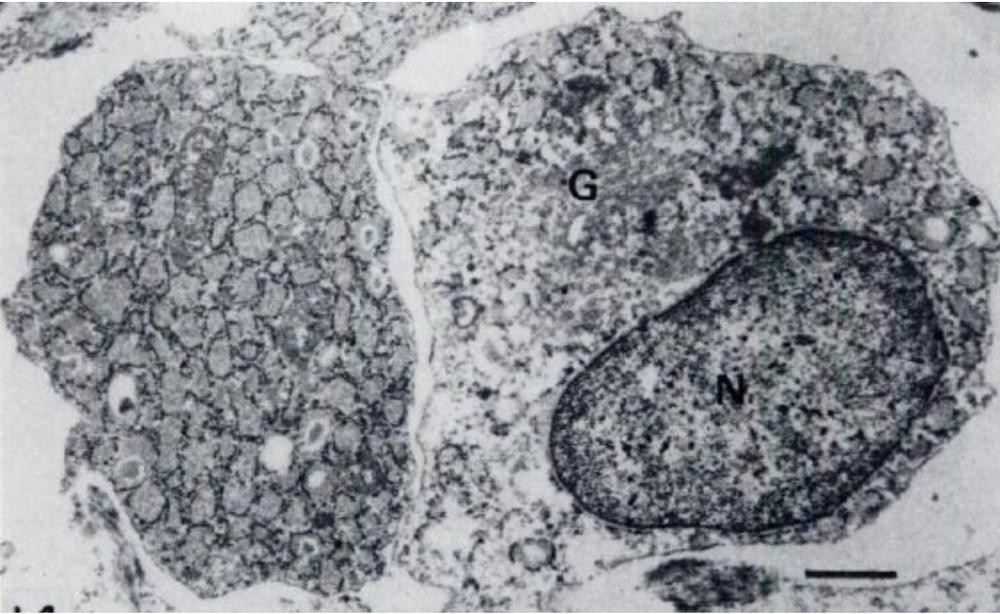

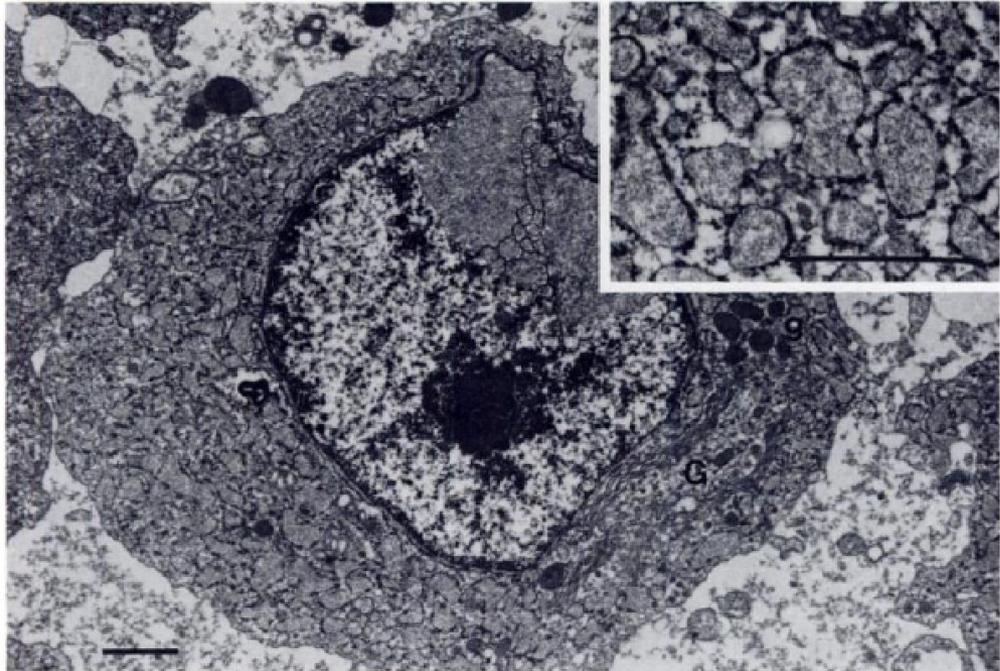

FIGURE 3. Electron microscopy of different cell types from the Leydig organ. Bar = 1  $\mu$ m.

# Плазматические клетки акул

Из селезенки

Из органа Лейдига

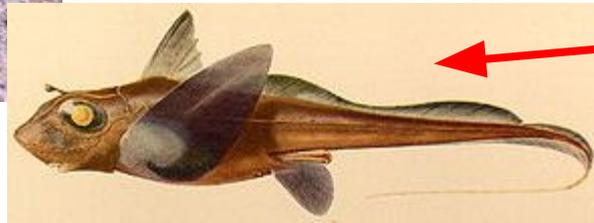

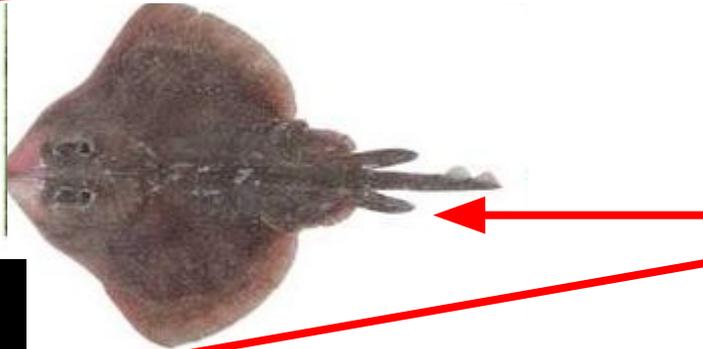

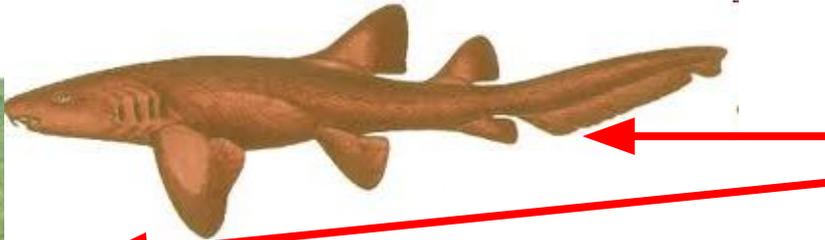

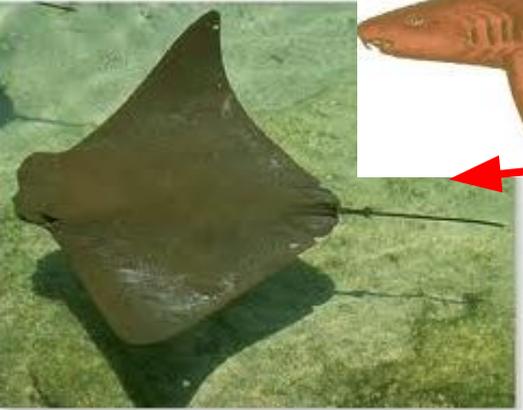

# Важнейший вклад в изучение лимфоидных органов хрящевых и костистых рыб внесла в 50-80х годах группа доктора Рагнара Фанге

Только эпигональный орган, без органа Лейдига имеют акулы и скаты *Ginglymostoma cirratum*, *Rhinoptera bonasus*, *Heterodontus francisci* и *Negaprion brevirostris*.

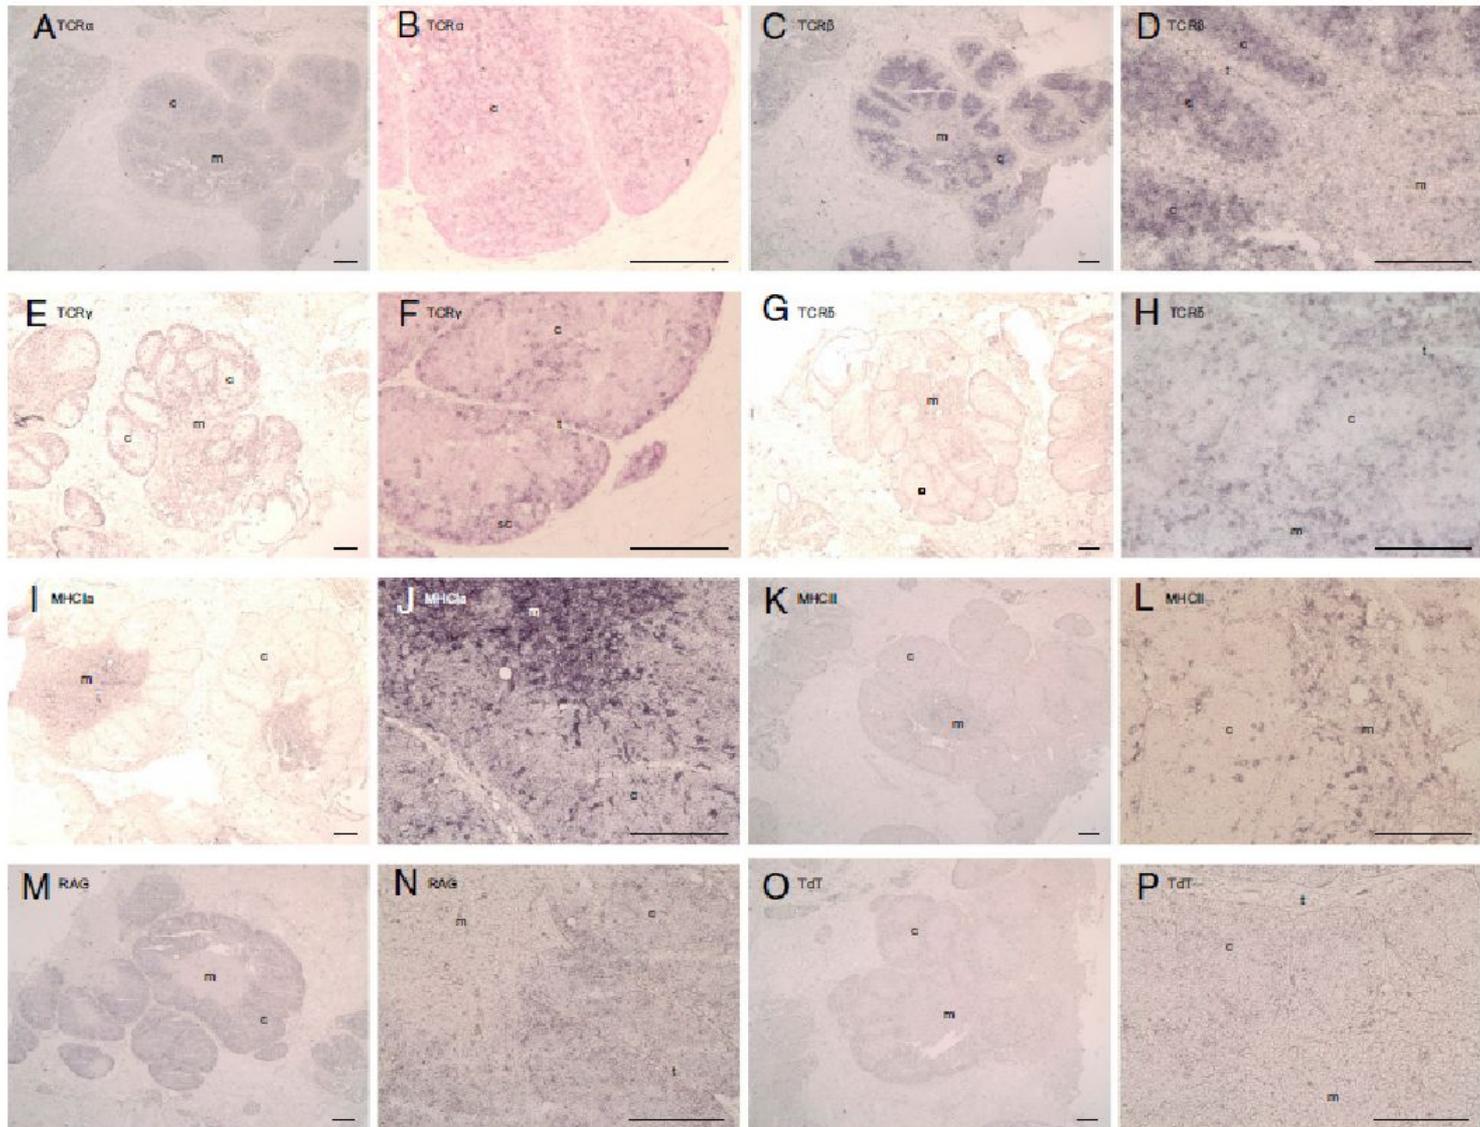

Оба органа присутствуют у видов *Raja sp.*, *Scyliorhinus canicula*, *Scyliorhinus stellaris* и *Sequalus acanthias*.

Только орган Лейдига остался у *Somniosus microcephalus*, *Etmopterus spinax* и *Torpedo sp.*

У некоторых хрящевых рыб, например у цельноголовых (химеры) отсутствуют оба этих органа.

# Иммуногистохимическое окрашивание тканей тимуса акулы

**FIGURE 6.** In situ hybridization of shark thymus. Positive hybridization is purple. TCR $\alpha$ C probe (A, B), TCR $\beta$ C probe (C, D), TCR $\gamma$ C probe (E, F), TCR $\delta$ C probe (G, H), MHC class Ia probe (I, J), MHC class IIb probe (K, L), RAG1 probe (M, N), and TdT probe (O, P). Scale bar, 100  $\mu$ M; original magnification  $\times 10$  and  $\times 20$ . Negative controls with sense probes (not shown) showed no staining. c, cortex; m, medulla; t, trabeculae.

B-cell development in teleosts

Rag expression

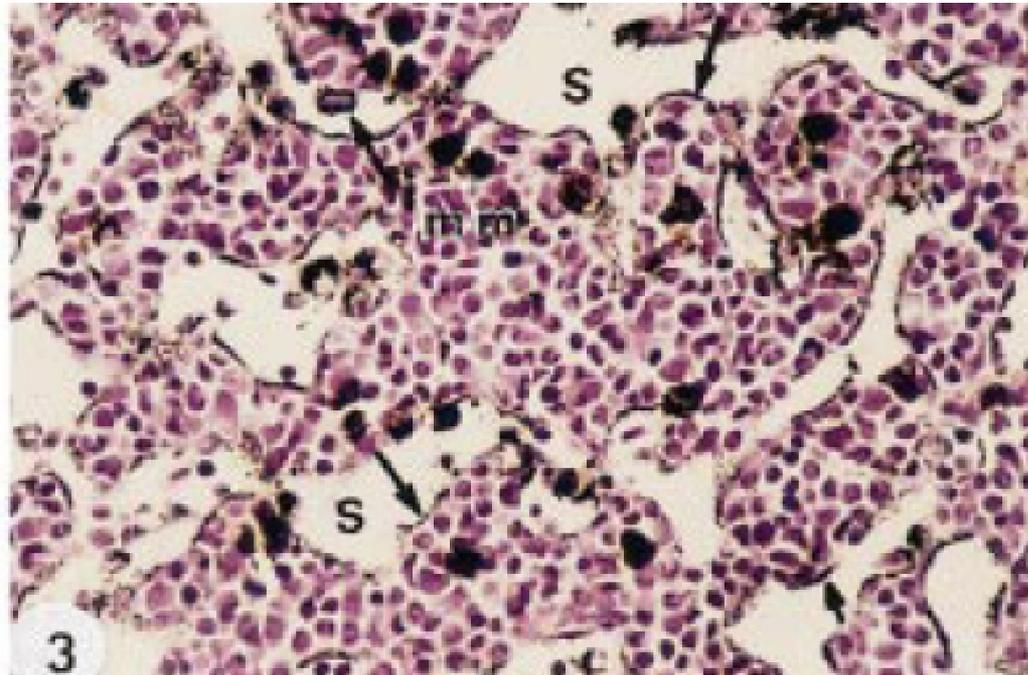

Species	Organ	Method	Day
Zebrafish	Kidney	wish	—
	Pronephros	ISH on tissue sections clusters	First cells 2 wpf
		Pronephros	ISH on tissue sections
	Pronephros	Rag-2,GFP	8 dpf
	Wholefish	RT-PCR	3 dpf
	Pancreas	wish	4 dpf
Rainbow trout	Wholefish	RT-PCR	10 dpf (before appearance of thymus and kidney)
	Pronephros	ISH on tissue sections	Hatching

Ig expression

Species	Organ	Evidence	Method
Zebrafish	Wholefish	VDJ( $\mu$ ) rearrangements	PCR amplification of genomic DNA
	Wholefish	IgM expression	RT-PCR
	Wholefish	IgM expression	ISH on tissue sections
	Wholefish Kidney	IgLC isotype IgLC isotype	RT-PCR ISH on tissue sections
Rainbow trout	Wholefish	cIgH-cells	Immunohistochemistry
	Wholefish	IgL	ELISA
	Pronephros	SIgM + cells	Immunohistochemistry

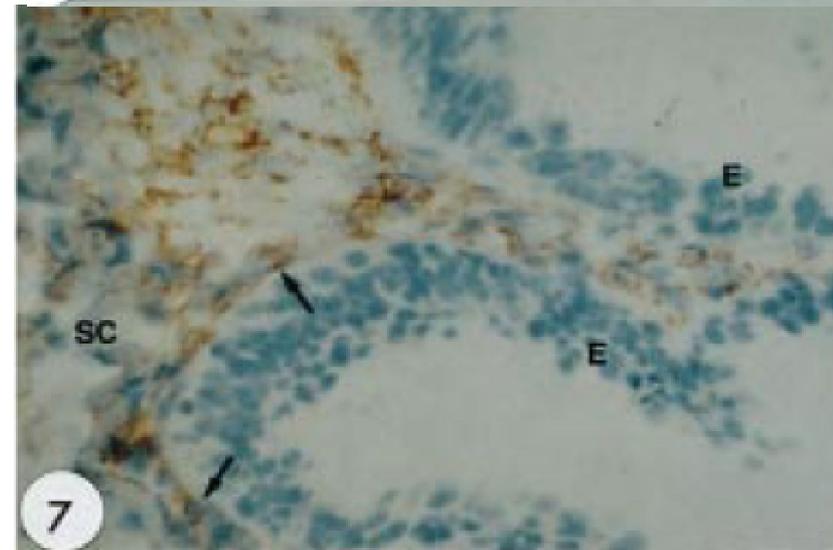

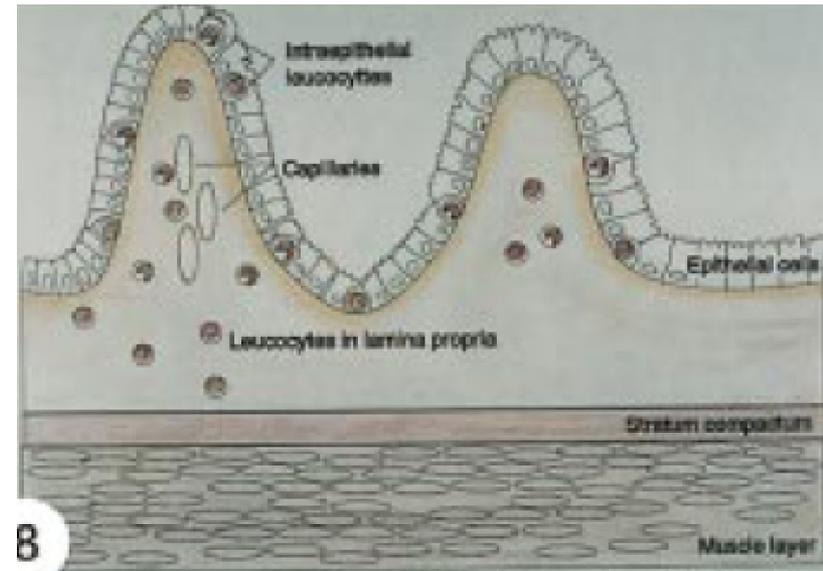

# Лимфомиелоидные ткани костных рыб

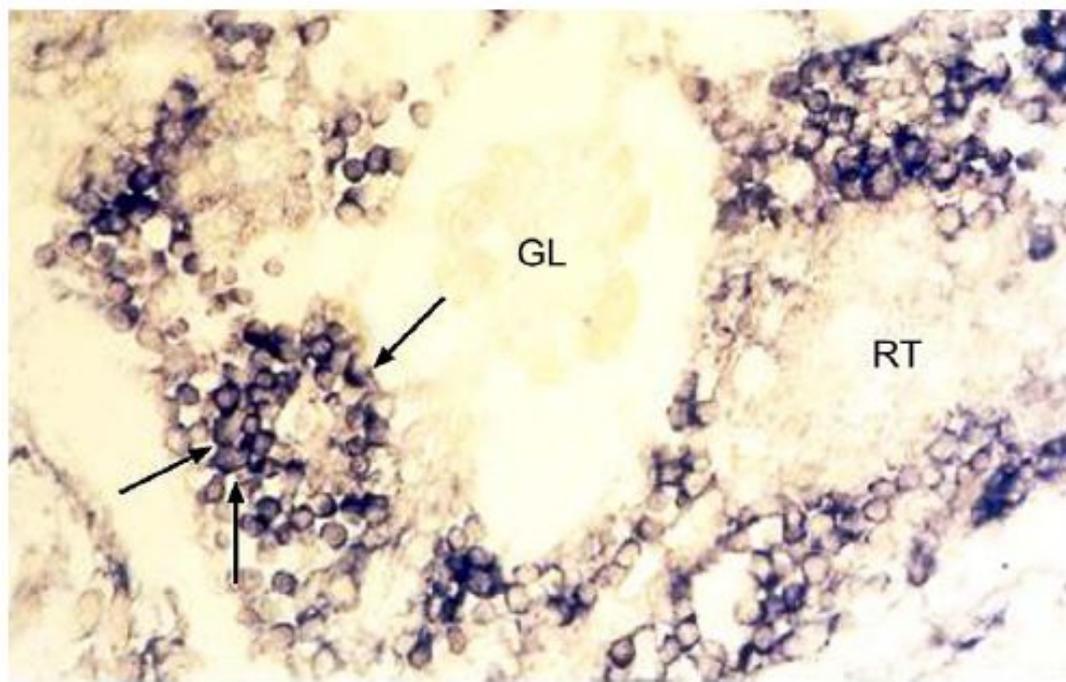

Головная почка – первичный источник иммунных клеток

Стрелками отмечены частицы активированного угля, введенные форели в брюшную полость и сорбировавшиеся в почечных синусах. Также видны меланомакрофаги.

Стенка кишечника форели

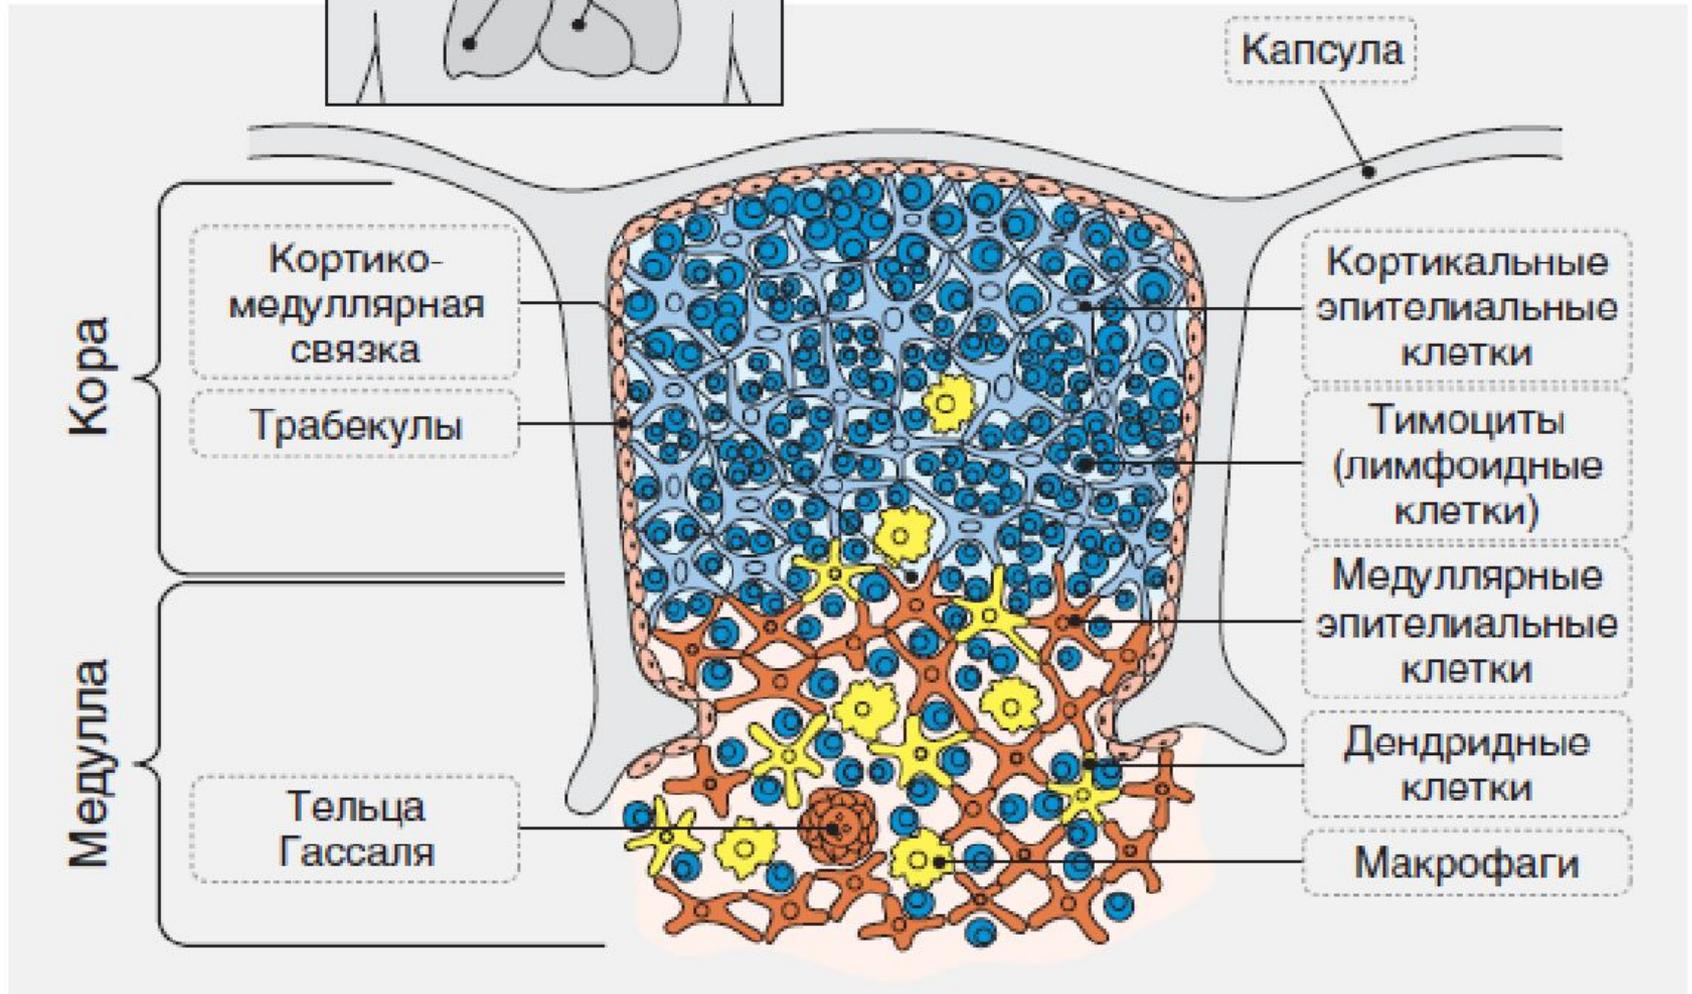

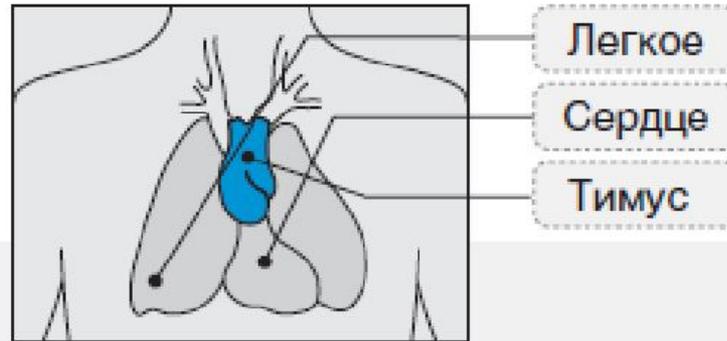

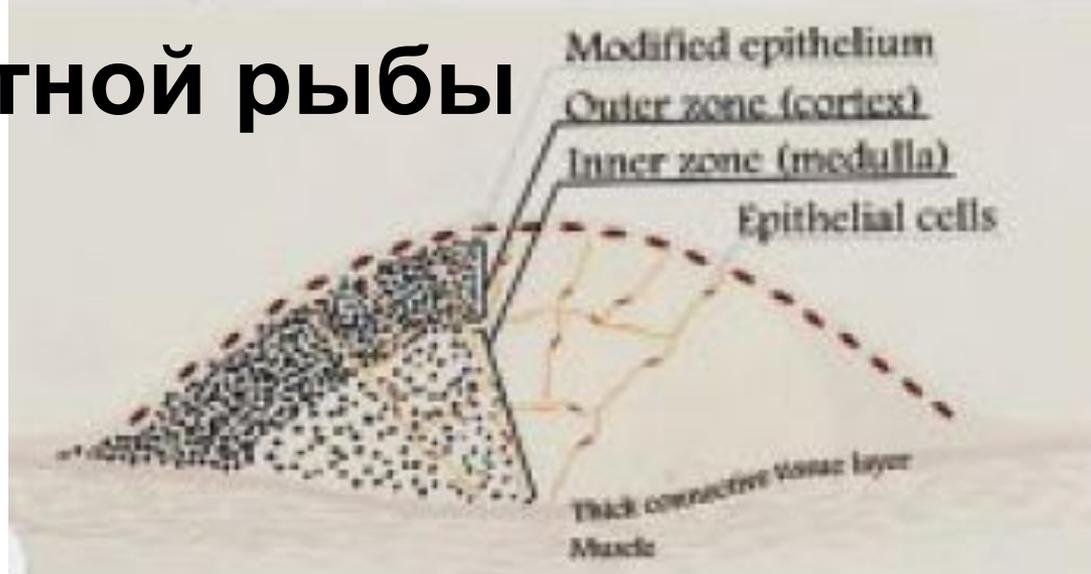

### Maturation of immunological competence

Species	Lymphocytes in Lymphoid organs	Appearance of Ig + cells	Allograft rejection	Humoral immune response
Rainbow trout (14 °C)	Thymus (8 d pre-hatching or 3 days) Kidney (4–5 days) Spleen (6–14 days)	4 d (Kidney)  1 m (spleen)	14 days	8 w (HGC + FCA) <i>A. salmonicida</i>
Carp (22 °C)	Thymus (3 d–5 m) Kidney (6 d–6 m)  Spleen (8 d–10 m)	1 m (spleen)	16 days	4 w (no response to SRBC) 8 w (response to both HGG + FCA and <i>A. salmonicida</i> )
Zebrafish	Thymus (3 dpf) Kidney (1–2 w) Spleen (more than one month)	2 w (kidney)		Secreted Ig against <i>A. hydrophila</i> HGG (6 w onward)

M cells	+	-
Peyer's patches	+	-
MLNs	+	-
ILF	+	+
Secretory Ig	IgA	IgX (functional analog of IgA)

Components	Mammals	Amphibians
<b>Primary lymphoid organs</b>		
Thymus	T-cell differentiation	T-cell differentiation
Bone marrow	B-cell differentiation	Neutrophil differentiation and presence of macrophage precursors
<b>Secondary lymphoid organs</b>		
Spleen	T- and B-cell activation	T- and B-cell activation B-cell differentiation in tadpole and adult (in tadpole, B cells differentiate also in liver)
Lymph nodes	T- and B-cell activation	Unknown
GALT	T- and B-cell activation	T- and B-cell activation (unclear)
MLNs	T- and B-cell activation	(Absent structures)
Peyer's patches	Mostly B-cell activation	(Absent structures)

**Maternal Ab**

**Tailbud stage**  
Innate-type myeloid cells

**Larvae: B & T cell Ag recognition but inefficient effector system**

- Larval type BCR & TCR repertoires
- Very low or no surface MHC class I expression
- CD3 $\epsilon$ <sup>+</sup> cells but no B cells in GALT
- Weak B cell & Ab responses
- Poor switch IgM to IgY
- Incomplete skin graft rejection (e.g., tolerance to minor H-Ags)
- No detectable NK cell and NK cell activity
- CD8 T cells but no detectable CTL activity
- Weak T helper-like MLR

**Metamorphic to 6 month-old adult: Down regulation of immune responses**

- Thymic histolysis
- Thymus migrates towards the tympanum
- Incomplete skin graft rejection
- Weak anti-tumor responses
- NK cells but no NK cell killing activity
- T helper-like MLR impaired

**One year-old adult or older: Efficient anti-viral & anti-tumor immune responses**

- Adult type BCR & TCR repertoires
- MHC class I express on all cells
- B & T cells in GALT
- More efficient B cell & Ab responses
- Acute skin graft rejection including minor H-Ag-disparate
- Potent NK cell killing activity
- CTLs against major and minor H-Ag
- Stronger, MHC class II-dependent, T helper-like MLR

**Long lasting immunological memory**  
DNP-KLH, minor H skin Ags, and Tumor Ags

## Summary of the Main Developmental Steps of the *Xenopus* Immune System

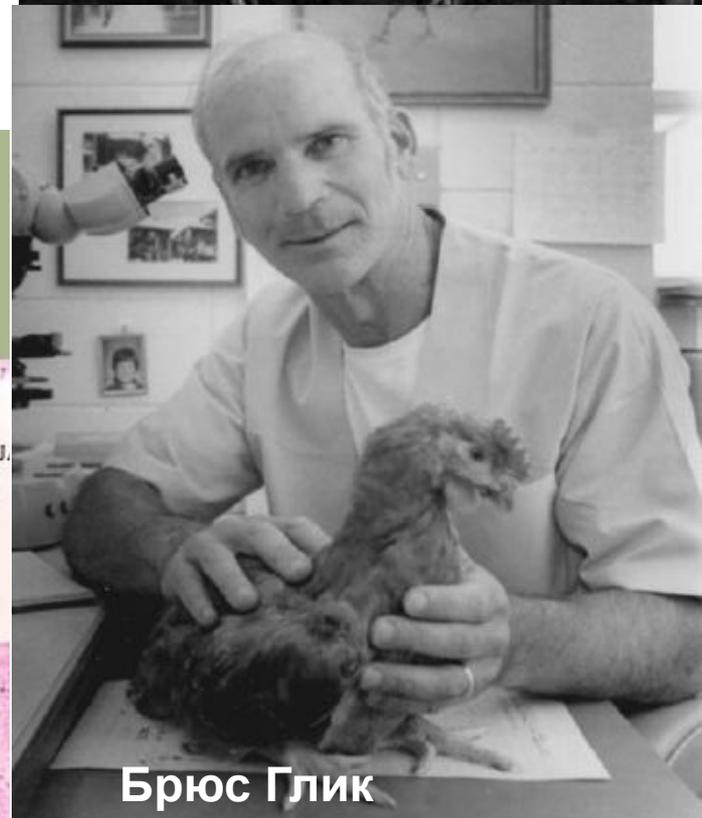

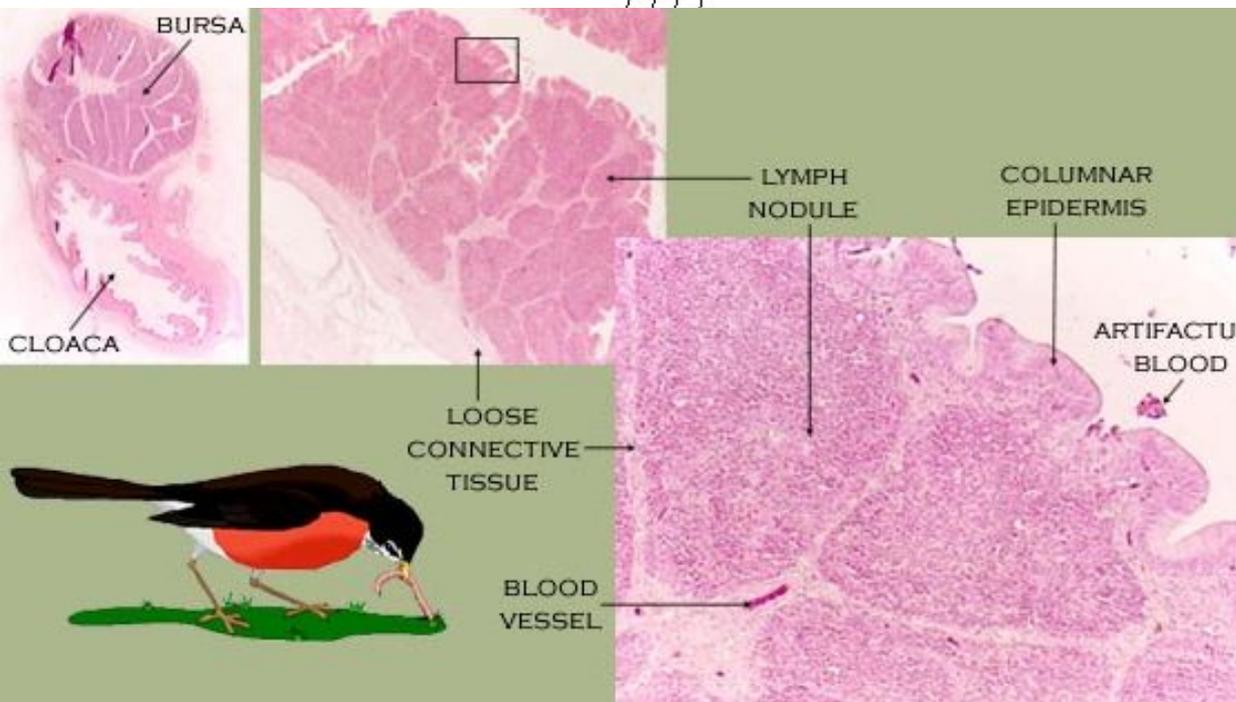

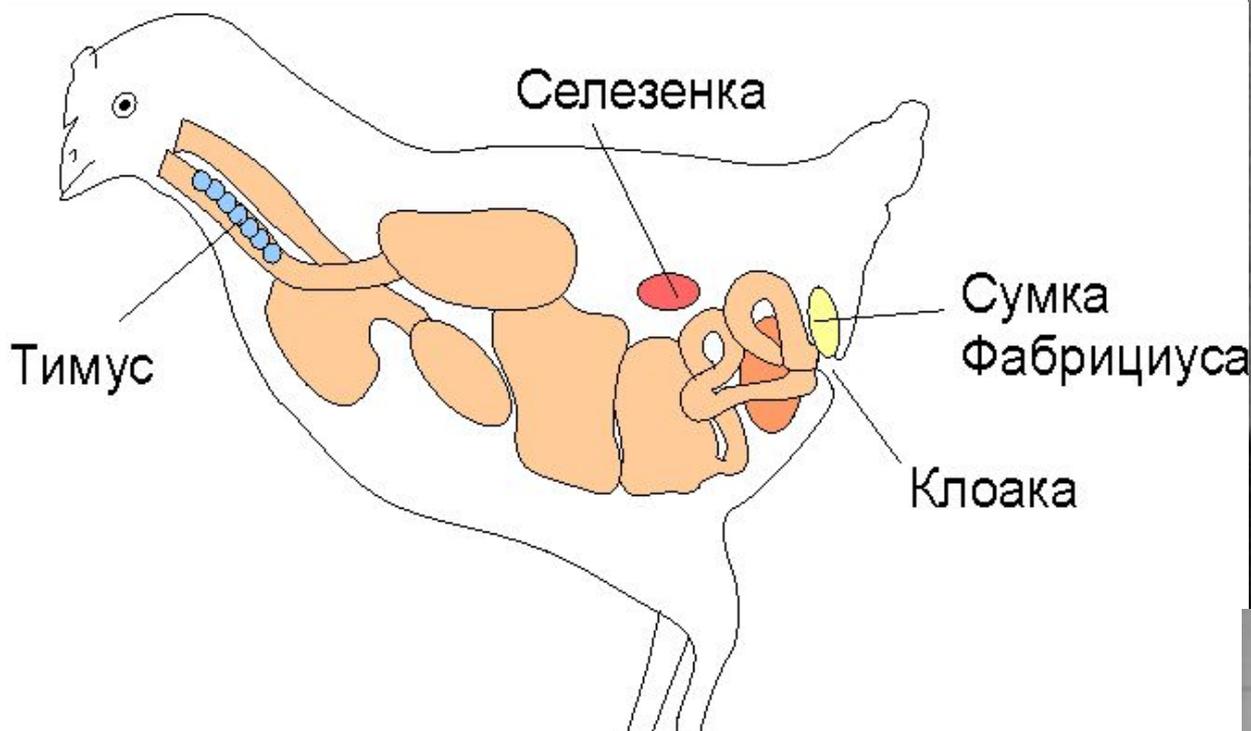

Devel. stages (days)	Liver	Thymus	Spleen	GALT
40 (d3)		Thymic epithelium buds from 2nd visceral pouch	Absent	Few scattered CD3ε Expressing leukocytes
46 (d4)	Lymphopoiesis in peripheral layer, Ig (μ) and sterile TCRβ RAG, AID	Epithelium, no precursors	Spleen anlage mesenchymal thickening in the mesogastrium	No B cells
47 (d4–5)	Lymphopoiesis, and B cell development in absence of Ag	Colonization by Lymphopoietic precursors from post-VBI (~100 cells) RC47+	Blood cells (No Lymphopoiesis)	
48 (d6–7)		Cortex-medulla, full TCRβ mRNA, CD3ε CD8+ Thym, class II+ epithelial cells		
49 (d10–13)	IgL rearrangements	First CTX+ thymocyte, more CD8+	Spleen B cells (~200) and 1st detect Ab responses	
50 (d15)		Ongoing thymocyte differentiation (3 × 10 <sup>4</sup> cells)		
56 (d38)		Ongoing thymocyte differentiation (9 × 10 <sup>5</sup> cells)	Detectable T cell responses	
58 (d44)		Max. size of the thymus (1–2 × 10 <sup>6</sup> cells)	Max. larval T cell response (1 × 10 <sup>6</sup> cells)	
Adult (>d60)	Adult-type leukocytes	Thymus move near tympanum New adult-type thymocyte differentiation	Adult T cell responses (1–2 × 10 <sup>7</sup> cells)	
Adult (> 1 yr)		Thymus progressively filled by fat tissues	(1–2 × 10 <sup>7</sup> cells)	Many IgM+ and IgX+ B cells, as well as T cells (CD8+ and CD8-)

# Иммунитет у головастика и взрослой лягушки

Table 1. Summary of immune responses to FV3 in larval and adult *X. laevis*.

	Adults		Larvae
	Primary	Secondary	
Symptoms	2–3 weeks	3–5 days	Long lasting, >80% death
Virus Clearance	1 month	1 week	Ineffective
<b><u>Innate Immunity</u></b>			
Cells	1 dpi: Activated Mø 3 dpi: NK cells	Same + Mø as APC Similar to primary	Mø less resistant to FV3 No NK
Induced genes	1 dpi: TNF- $\alpha$ , IL-1 $\beta$ , IFN- $\gamma$ , Mx1	Similar to primary	Delayed (3 dpi) and weaker
<b><u>Adaptive T cell immunity</u></b>			
Splenic CD8 T cell	Peak at 6 dpi	Peak at 3 dpi but lower expansion	?
CD8 T cell in kidneys	At 6 dpi	At 3 dpi but fewer	?
T cell memory	-	yes	?
<b><u>Adaptive B cell immunity</u></b>			
Anti-FV3 antibodies	Not detected	IgY from 10 dpi	Not detected
More IgY mRNAs	6 dpi	3dpi	6–7 dpi
AID up-regulation	9 dpi	3 dpi	6–7 dpi
B cell memory	-	Yes	Possibly

Abbreviations: AID: activation-induced cytidine deaminase; dpi: days post-infection; Mø: Macrophages.

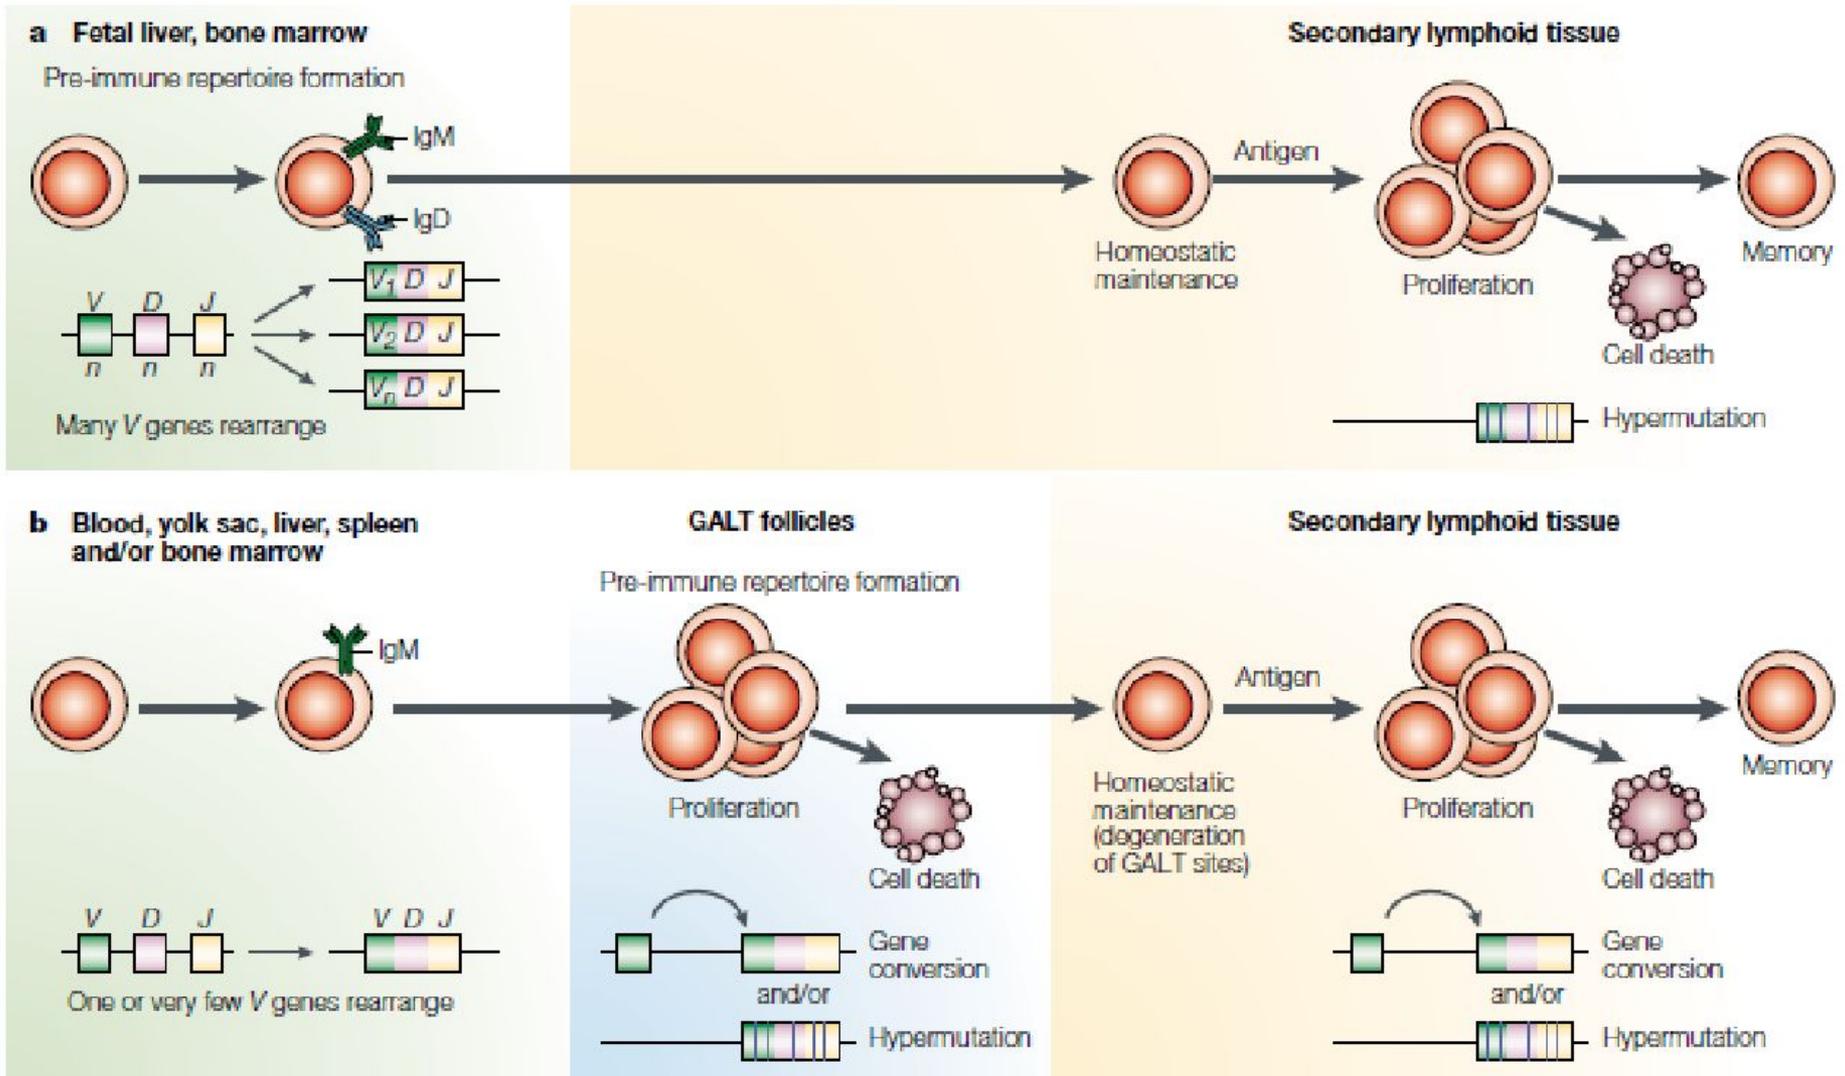

# Созревание В-лимфоцитов у курицы

	Ig gene remodelling	organ	ontogeny
<b>pre-bursal stage</b>			
	D <sub>H</sub> -J <sub>H</sub> recombination	yolk sac	embryonic day 5-6
	completion of V(D)J recombination	spleen, thymus, blood etc.	embryonic day 7-15
<b>bursal stage</b>	gene conversion (high) somatic hypermutation (low)	the bursa of Fabricius	embryonic day 15 - after hatching (until involution of the bursa at 4-6 months after hatching)
<b>post-bursal stage</b>	gene conversion (high in early GC stage low in late GC stage)  somatic hypermutation (high)	splenic germinal centers (GCs)	after 3 month old
