dominate specific inform cause provide condition

Child public health in the twentieth century

Although the medical profession played a role in advocating and enabling change, the improvements in child public health that occurred in the eighteenth and nineteenth centuries were achieved almost entirely through changes to the social and environmental conditions in which children lived. During the twentieth century, particularly the latter half, public health was also informed by advances in understanding of the causes of disease and the development of medical practice. Indeed, public health practice became increasingly dominated by the provision of medical services and by attempts to prevent or treat specific diseases and conditions.
