Cyber Security Specialist

Cybersecurity is a huge field, just like IT.

A cybersecurity specialist protects IT systems from hacks and malware, stops and prevents data theft and leakage. In addition, cybersecurity specialists are proactive: they calculate possible risks and vulnerabilities of the system and strengthen its protection.
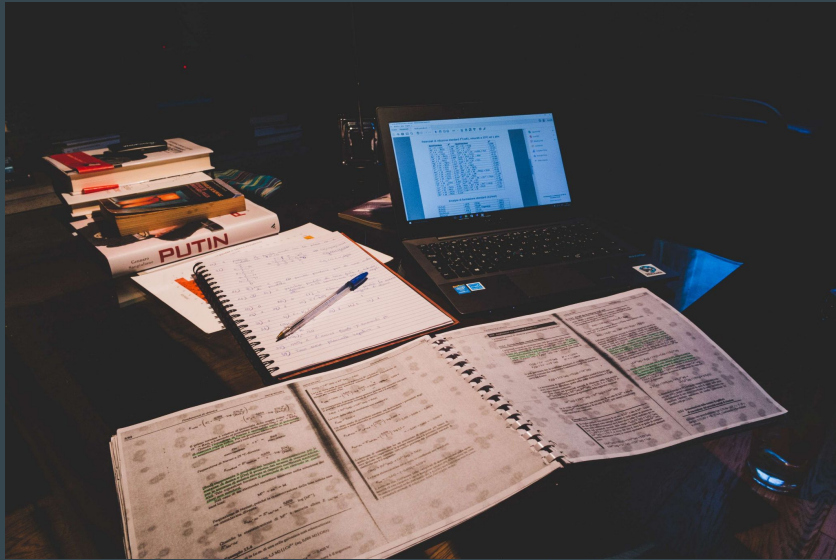

When information about a new vulnerability comes out, we investigate it, checking to see if there are services in the bank that can be hacked because of it. We figure out how this vulnerability works, where it is used, and write detections.

The average salary of such a specialist in Russia is 65 thousand rubles, but it varies depending on experience. Without experience - 50 thousand rubles, with experience of 1-3 years - 80 thousand rubles, 3-6 years - 110 thousand rubles, over 6 years - 290 thousand rubles.

To become a cybersecurity specialist, you need a technical degree. The specialty must be related to automation, programming, mathematics, or as such, security.

Thank you for your attention!!!
