

Innovations and technologies

Introduction

Since their beginning, people have been trying to analyze events and have been trying to foresee their future within different periods of time, from several hours and to centuries. And, it's not easy to realize it.

Introduction

In my opinion, people to trust in future predictions are scientists. They usually have deep knowledge in their field.

My vision of the future will be based on the modern level of the development of the humanity and on scientific predictions as well. Mostly, they'll be linked with the technological sphere.

World and society

Human social links will be greatly influenced by technologies and online world.

Live interaction won't be not so wide-spread as now.

World and society

Here, there're some of the possible ways to interact.

- smart glasses and contact lenses
- holographic gadgets
- smart communication implants
- clothes built on a smart fabric
- artificial eyes

World and society

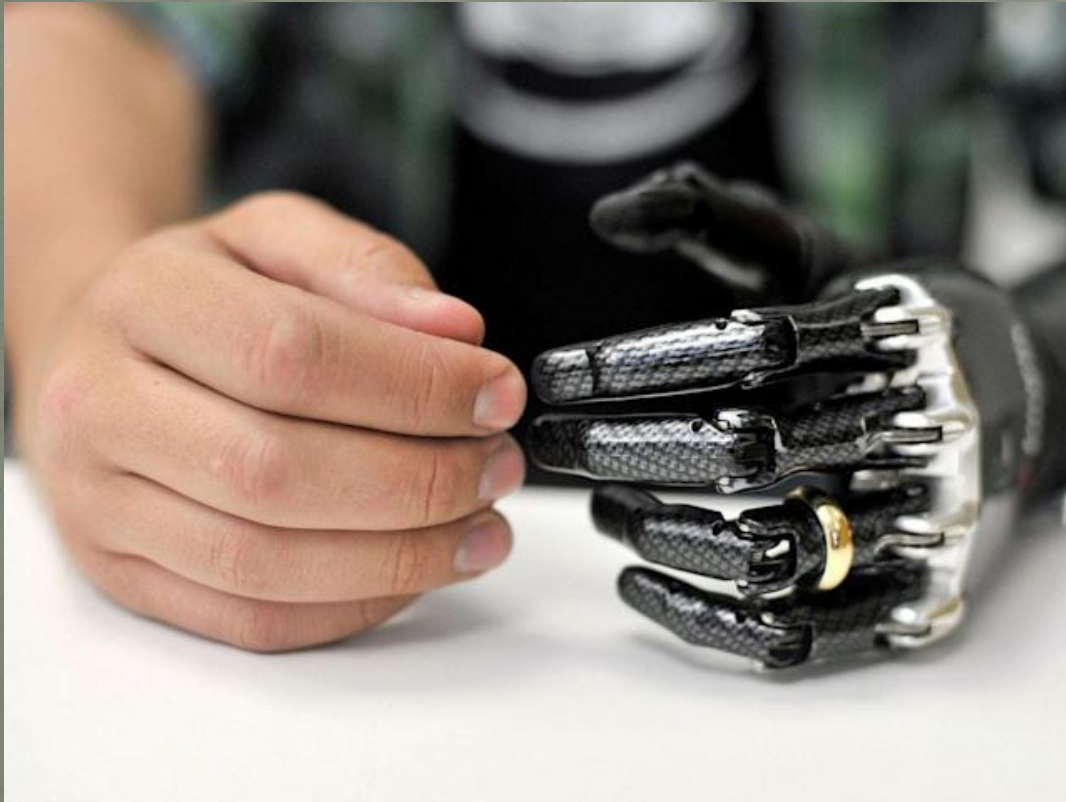

This sphere will be threatened by malicious computer users known as hackers who will break in other people's private world and use private information in their own destructive goals.

Health

Future achievements in medicine will be outstanding. There'll be a big success in 3D printing of prosthetics, in genomics, in use of exoskeletons, in use of stem cells, of artificial organs and neurons and tissues, and, in xenotransplantation.

Health

Cyborgization will also play an important role in health care. It will help to restore organs and parts of body lost or to improve a human body.

Health

Nevertheless, it could cause new and unknown medical problems such as two-speed medicine, new illnesses and viruses, hacking of human brain and digital-based mental disabilities.

Accommodation and transport

Cars and public transport will be more secure, more comfortable, more eco-friendly, with no human assistance, with built-in artificial intelligence. They'll fly to different distances.

Accommodation and transport

Our future homes will have various AI upgraded technological features and functions that will make living there more comfortable.

Accommodation and transport

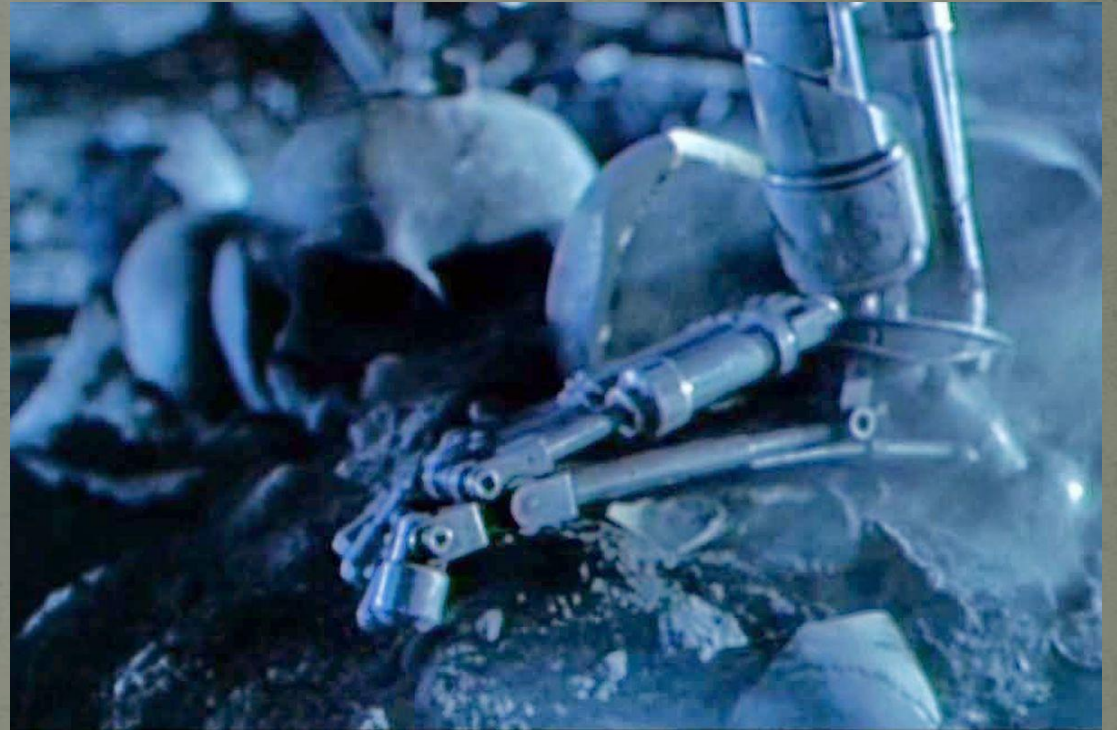

Robots will become an everyday part of us.

They'll be everywhere we need: at workplace and at home assisting us to make our living better.

Accommodation and transport

Despite the profits of robot use, no one can tell that systems will be always under human control and won't harm us.

Conclusion

The best things to see
in future technologies

They must be secure, comfortable,
human-friendly, fail-safe,
augmenting human physical and
mental capacities and ways to
self-develop and to entertain

The worst things to happen because
of future technologies

Virtual world and smart devices
could absolutely absorb human
identity and uniqueness and
conquer us.

THANK YOU FOR YOUR
ATTENTION!
