Help!!!

Perhaps you have forgotten to leave all seashells on the seashore!

If so, please drop them in the container below and we will gladly take them back to the beach for you!

## Why?

- Empty shells are used by other creatures, like the hermit crab, as a shield for protection.
- The minerals in the shells break down in seawater and young shellfish recycle them to form their new living seashells.

- Les coquillages vides peuvent être comme le bernard-l'hermite, pour
- Les minéraux des coquillages se dissolvent dans l'eau de mer et les jeunes mollusques les recyclent pour

Please leave all seashells here!

Laissez vos coquillages
