Lviv, Ukraine

- ❑ **Несколько слов о компании ProQuest**
- ❑ **Что предлагает ProQuest библиотекам:
краткий обзор ресурсов**
- ❑ **Базы данных по техническим наукам**
- ❑ **Платформа ProQuest**

О компании ProQuest

- ❑ Американская компания. Штаб-квартиры в USA (Анн Арбор) + представительства по всему миру
- ❑ ProQuest - поставщик электронной информации для высшего образования и научных исследований
- ❑ Деятельность с 1960-х гг.
- ❑ 150.000 подписчиков по всему миру, включая крупнейшие университеты Америки, Европы, Азии

What's New

For ProQuest Customers...

A brief message of importance from CEO Marty Kahn.

Visit us on stands 60 to 61, at FESABID

To find out how your Library or Institution can benefit from real research solutions, come visit us at stands 60 to 61 at the FESABID conference in Zaragoza, Spain. From 20th - 22nd May 2009.

Knowledge is Power

Make the most of your ProQuest databases—learn at your own pace with our self-learning tutorials or sign-up for one of our online sessions with an experienced ProQuest trainer.

РИС.2. Модель химических структур полимеров.

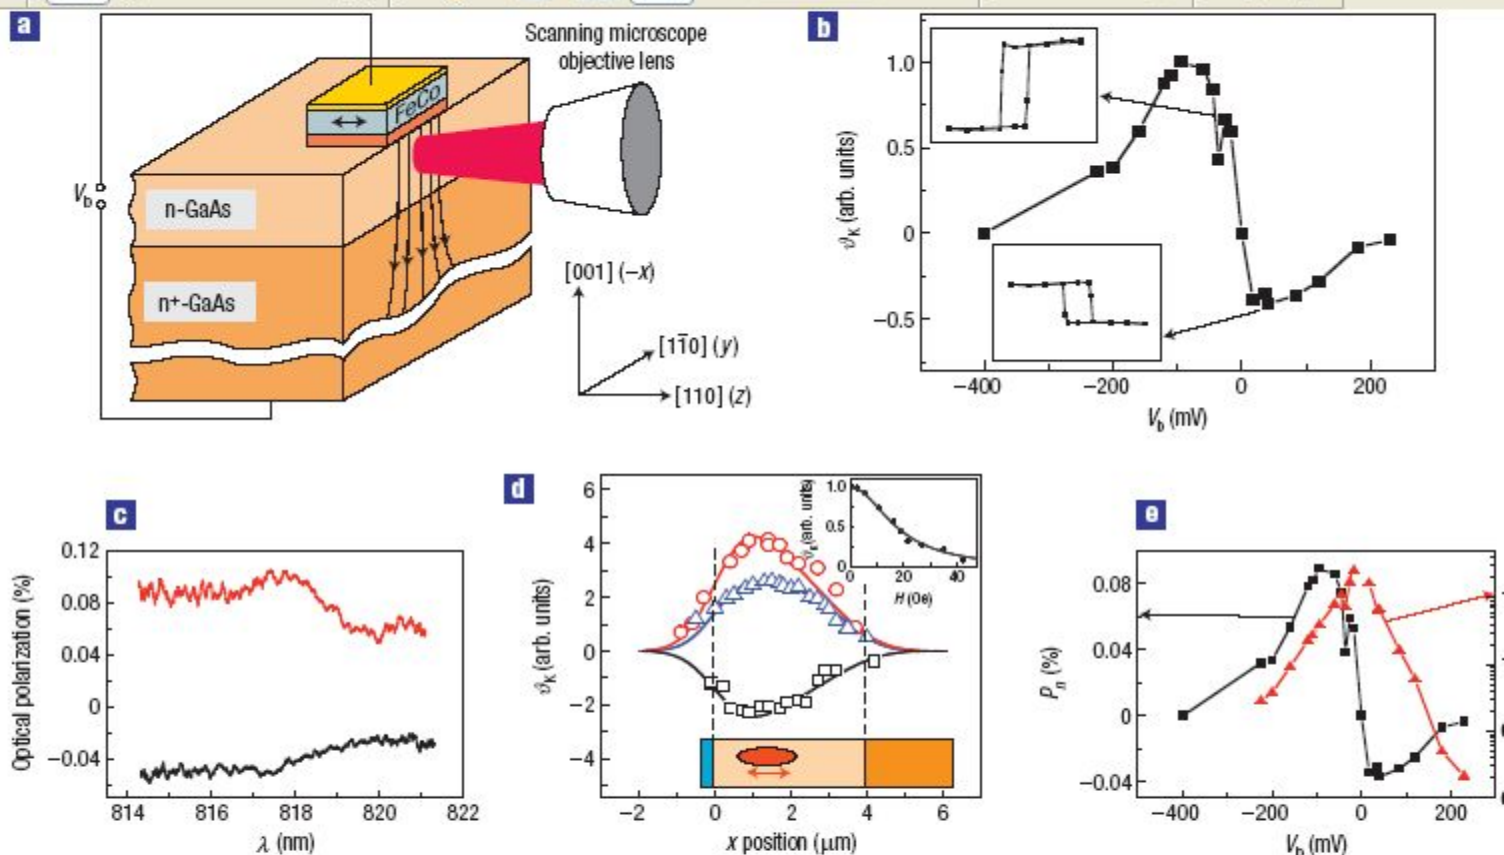

Figure 3 Characterization of the injected spin polarization in the vertical-current geometry. **a**, Sample design for vertical-current measurements where—in the lateral geometries in Fig. 1 or in refs 6,22—the energy of the injected electrons, ϵ_e , to a very good approximation is given by the bias voltage ($\epsilon_e = eV_b$). **b**, Amplitude versus applied bias voltage for the sample of **a** measured in the n channel. The insets clearly show the change of sign in the Kerr rotation versus magnetic field. **c**, Degree of circular polarization of the light emitted by a combination of electroluminescence (EL) and photoluminescence (PL) of the n channel for $V_b = -50$ mV (red circles) and for $V_b = +50$ mV (black squares) for optical excitation at a wavelength of 800 nm for the sample of **a**. **d**, One-dimensional Kerr scans in the vertical direction ($x \parallel [001]$) for the sample of **a** for bias voltages of -40 mV (red circles), -200 mV (blue triangles) and $+50$ mV (black squares). The solid lines represent the calculated Kerr signals that take into account the gaussian profile of the laser spot and a spin-density profile on the basis of equation (1) for the respective bias voltages. The inset shows the spin polarization function of a small transverse magnetic field applied in the x direction (data points) and a numerical fit (solid line) taking into account the precession around the field (Hanle effect; see the Supplementary Information). Resulting fit parameters are $D = 5 \text{ cm}^2 \text{ s}^{-1}$ and $\tau = 100 \text{ ns}$. **e**, The spin polarization of the electron density is deduced from **b** using the luminescence data of **c** as a calibration: the spin polarization of the current (P_n , red) is deduced from P_K by using equation (1). Here

ProQuest Dissertations and Theses: уникальная база данных научных диссертаций

$$\Phi_{wall} = \frac{\gamma H_p \pi r_p^2}{2} \left[-\frac{d^2 h(x)}{dx^2} \right] \quad (6.5b)$$

$$\Phi_{vol} = \left[[\rho_{particle} - \rho_{liquid}] (x_{vol}) + [\rho_{particle} - \rho_{gas}] (1 - x_{vol}) \right] V g h(x) \quad (6.5c)$$

In these expressions, $C_{00} = h(x=0)$, l_{cap} is the capillary length, γ is the surface tension r_p is the characteristic length of the particle, H_p is the quadrupolar amplitude, V is the volume of the particle, g is acceleration due to gravity, x_{vol} is the volume fraction submerged by the liquid, and $\rho_{particle}$, ρ_{liquid} , and ρ_{gas} are the respective densities of the particle, liquid, and vapor. The energy differential can be written:

$$\frac{d\Phi_{total}}{dx} = \frac{-\gamma H_p \pi r_p^2}{2} \frac{d^3 h(x)}{dx^3} + \left[[\rho_{particle} - \rho_{liquid}] (x_{vol}) + [\rho_{particle} - \rho_{gas}] (1 - x_{vol}) \right] V g \frac{dh(x)}{dx} \quad (6.6a)$$

Migration away from the wall is favored if

$$\frac{d\Phi_{total}}{dx} < 0 \quad (6.6b)$$

Consider equation 6.6a in the limit in which x_{vol} approaches unity and the vapor density is negligible. Migration away from the wall is predicted if:

$$\frac{\gamma H_p \pi r_p^2}{2} \frac{d^3 h(x)}{dx^3} > (\rho_{particle} - \rho_{liquid}) V g \frac{dh(x)}{dx} \quad (6.6c)$$

Noting that the third derivative of h is negative, the left hand side of equation 6.6c is positive. In our experiments, particles indeed migrated away from the capillary rise

Figure 6.3: (a) Schematic of particles which curve so that Ag film has largest arc length owing to Interfacial stresses. (b) (Right) A magnetic field forces non-preferred alignment of a concave-down particle. (Left) Upon removal of the magnetic field, the particles spontaneously return to the preferred alignment

Сравнение трех Рентгеновской эмиссии технологии с применениями к тонкой пленке и образцам массы в том числе низкая энергия тяжелый-ион частица-побудила Рентгеновскую эмиссию spectroscopy

автор *Streib, Kenneth Lee*, Ph. D., Университет Штата **Аризона**, 2003, 152 pages; AAT 3109615

Краткий обзор (Резюме документа)

Три технологии Частицы Побужденная Рентгеновская Эмиссия (PIXE), Рентгеновская Fluorescence (XRF) и Ознакомительное исследование Электрон Microscopy-энергия Дисперсионная Spectroscopy (SEM-EDS) описываются. Оборудование использованное ибо каждое описывается в некоторой детали, и некоторой из преимуществ и недостатков каждой технологии обсуждаются. Вакансия lifetimes и fluorescence выход обсуждаются. Система произвести PIXE исследования в Nanofab фокусировали луч иона обсуждается. Расчеты тогда описываются который сравнивают три технологии для глубины анализа. Расчеты показываются которые дают идею ionization и рентгеновского производства пересекают-секции этих трех технологий. Два метода вычисления энергия для максимума *K раковина ionization пересекают-секцию* для электронов происшествия и протонов приводят к двум диаграммам таких значений. Крест-секции трех технологий сравниваются. Изменение в пике высота с изменением в Z материала образца исследуется для Рентгена fluorescence в тонких пленках.

В части 2, компьютерная программа известная как Внутренняя Раковина Ionization Поперечные Разрезы (ISICS) который использует Потерю энергии Coulomb Perturbed Постоянная Государственная Relativistic теория с Объединенным исправлением Атома (ECPSSR-UA) модель обычно порождала теоретические данные на поперечных разрезах. Данные поперечного разреза из этой программы тогда проверяются проверяя против экспериментальных данных установить ISICS ли точная или консервативная программа для того, чтобы предсказывать рентгеновские производственные поперечные разрезы. Эта программа используется тогда чтобы породить предсказания для PIXE в Фокусированном Луче Иона (FIB-PIXE) для трех ионов происшествия при 280 keV для выбрала рентгеновские линии. Это заключается что lithium источник иона значительно наилучший путь к попытке FIB-PIXE.

Adhesion and friction of polymer surfaces studied using scanning probe microscopy

автор [Moon, Seung-ho](#), Ph.D., **The University of Akron**, 2003, 208 pages; AAT 3108219

Краткий обзор (Резюме документа)

Scanning Probe Microscopy has been utilized to investigate the **nanomechanical** and **nanorheological** properties at the surface of polymers and polymer blends. To study the surface behavior in detail, it is critical that the SPM instrument have sufficient flexibility. A temperature stage and environmental chamber have been implemented and measurement automation has been achieved using a high-speed data acquisition system controlled by LabView(TM). Finally, new measurement protocols, "X-modulation" and "Force-Distance with X-modulation", have been developed.

First measurements using those techniques have been performed for the study of aged model pressure sensitive adhesives. It has been found that the magnitude of the lateral force is so sensitive to adhesion force that X-modulation can identify qualitative differences in the strength of surface stickiness. Variations in surface adhesiveness with humidity are more obvious when the tackifier is present. A large lateral force and strongly reduced stiffness, measured using F-d with X-modulation, have been observed at high humidity for the homogeneous, hydrophilic surface of the adhesive loaded with 60wt% tackifier. These observations are consistent with a model that envisions a tackifier-enriched region near the surface. A large creep effect has also been observed for this sample, and the creep effect is magnified with temperature. These results are consistent with the hypothesis that at a hydrophilic adhesive surface water molecules may strongly alter the surface-tip interactions or modify the mechanical properties of the material nearest the surface.

By changing the Z-loading velocity, dynamic adhesion behavior has been investigated. The mechanism of adhesive failure have been elucidated by comparing the velocity dependence of pull-off force and lateral force. Since this dynamic measurement is sensitive to the material composition at the surface, it has been utilized to study the surface segregation of one component at the surface in which the components differ only in architecture.

Extracting a quantitative description of polymer behavior using X-modulation has not yet been accomplished because several issues still remained unresolved such as the influence of certain instrumental artifacts, the accurate determination of stress/strain, and a lack of refined physical models for a **nanometer** scale contact with soft, adhesive materials. These current limitations are discussed.

**Можно ли опубликовать
свою диссертацию в PQDT?**

- С 2009 стартует программа публикации российских диссертаций в PQDT !!!
- Приоритет организациям – подписчикам
- 50 диссертаций в год публикуются бесплатно

- The Submission Process
 - Paper submissions (70%)
 - Online submission (30%)
 - Used by close to 100 publishing partners
- The Publishing Process
 - 8 – 12 weeks per submission
 - Faster with online submission
 - Individual review of each submission
 - Work with institution / author to resolve issues

- Вхождение в мировое научное информационное пространство
- Возможности увеличения индекса цитирования
- Присвоение ISBN каждой диссертации
- Регистрация и соблюдение авторских прав with the United States Copyright Office
- Долговременное сохранение каждой работы Long term preservation в цифровом формате или на микрофишах
- Бесплатный доступ ко всем опубликованным диссертациям университета через **Dissertations & Theses @ service**
- Продажа и распространение диссертаций для ученых всего мира (с разрешения автора)

- Постоянная ссылка к реферату:
 - http://gateway.proquest.com/openurl?url_ver=Z39.88-2004&res_dat=xri:pqdiss&rft_val_fmt=info:ofi/fmt:kev:mtx:dissertation&rft_dat=xri:pqdiss:3246080
- Indexing of metadata on Google
 - <http://gradworks.umi.com/32/16/3216440.html>
- Возможность оплаты ройалти (денежного вознаграждения)

- Русскоязычный интерфейс
- Перевод документов на русский язык
- Дополнительные инструменты и опции для углубленного поиска
- Возможность подписки тематического тома
- Возможность заказа и приобретения любой диссертации в различных форматах
- Минимальная стоимость при максимальном объеме
- *Стоимость одной полнотекстовой диссертации - 0,5 руб. при подписке на всю БД*

Nanotechnology and Immunoassay

Samuel I Stolper, Sonny S Mark, Jason Y Park, Larry J Kricka. *Clinical Chemistry*. Washington: Oct 2007. Том 53, Iss. 10; pg. 1874, 1 pgs

Краткий обзор (Резюме документа)

Metallic and semiconductor nanoparticles, for example, are gaining popularity as highly sensitive labels (e.g., in fluorescent detection and Raman tagging), and magnetic nanoparticles are being used as solid supports for immunoassays. Optical Detection (Chemiluminescence, Chromatographic Separation, Fluorescence, Nephelometry, Phosphorescence, Resonance Scattering, Spectroscopy, Surface-Enhanced Raman Spectroscopy, Surface Plasmon Resonance); 5.

To the Editor:

The roots of nanotechnology can be traced back to colloid science in the mid-19th century. Francesco Selmi, often credited with the first true research in the field, studied the behavior of various metallic and acidic emulsions in the 1840s (1). Shortly thereafter, Michael Faraday and Thomas Graham, two scientific pioneers known primarily for their work with electricity and diffusion of gases, respectively, contributed further to the analysis of nanoparticulate suspensions, i.e., colloids. Faraday's studies in electrochemistry naturally led him to the first experiments with colloidal gold (2), and Graham coined the term "colloid" after noting that certain substances showed slow diffusion rates through porous membrane (3).

Cournot Competition and Hit-and-Run Entry and Exit in a Teaching Experiment
Simon Gächter, Christian Thöni, Jean-Robert Tyran. Journal of Economic Education, Washington: Fall 2006, Vol.37, Iss. 4, pp. 418-433, 13 pgs.

Abstract (Summary):
Instructors can use a computerized experiment to introduce students to imperfect competition in courses on introductory economics, industrial organization, game theory, and strategy and management. In addition to introducing students to strategic thinking in general, the experiment serves to demonstrate that profits of a firm fall as the number of competitors is increased in a market and that firms enter profitable markets. The authors have used the experiment in undergraduate classes on strategy and management as well as in master of business administration courses with great success.

[Headnote]
Abstract:
Instructors can use a computerized experiment to introduce students to imperfect competition in courses on introductory economics, industrial organization, game theory, and strategy and management. In addition to introducing students to strategic thinking in general, the experiment serves to demonstrate that profits of a firm fall as the number of competitors is increased in a market and that firms enter profitable markets. The authors have used the experiment in undergraduate classes on strategy and management as well as in master of business administration courses with great success.
Key words: Cournot competition, entry, exit, experiment, teaching
JEL codes: A2, L1, D4, C9

Key ideas in strategic behavior are that firms take competitors' actions into account and make their best responses to them and that competition tends to reduce profits. These ideas can be introduced at different stages in education and at different levels of formal detail. The experiment we describe allows students to experience strategic competition and to witness the precision with which economic theory predicts such outcomes.

The purpose of the experiment is to introduce students to imperfect competition and strategic thinking in general. Our computerized teaching experiment has two phases. In the first phase, subjects participate in separate oligopolistic Cournot markets with different numbers of firms in each market. This phase allows a demonstration of the effect of market size on imperfect quantity competition. In the second phase, costless market entry and exit are possible. Theory predicts equalization of profits across markets as profitable markets attract competitors from less profitable markets. In both phases, the theoretical predictions are almost perfectly met by actual experimental play. The experiment is therefore a powerful illustration of the ideas of the static concept that fewer competitors in a market lead to higher profits and the dynamic concept that hit-and-run entry and exit tends to equalize profits across markets. We have successfully used this twophase experiment in undergraduate and master of business administration (MBA) courses. Although we have used the two-phase experiment, which we describe later, alternative organizations are possible as well. For instance, instructors can, according to their time budget and audience, choose to run the two phases at different sessions or only run phase 1.
