# Northeast Tiger

Let's get to  
know the  
Northeast tiger

speaker:Tang xiaoming

Northeast tiger, the scientific name of Siberian tiger, is the largest cat in the world and the largest tiger in the world. Among them, the adult male Siberian tiger has a body length of about 3 meters, a tail of more than 1 meter, an average weight of 250 kg(kilograms), and the largest individual can reach 350 kg. They are worthy of the "king of the jungle". Even brown bears have to take a detour when they see it, Strong sense of

territory

**According to preliminary statistics in 2019, the number of Wild Siberian tigers is about 700, most of them live in the Far East of Russia and only a few dozen live in Northeast China, In recent years, it has been rarely seen on the Korean Peninsula.**

**In the 1950s, there were still a large number of Siberian tigers. By the 1970s, the Siberian tiger had disappeared in Daxinganling. The survey in the 1980s showed that the Siberian tiger was on the verge of extinction in China, most of which were caused by human factors. China's poaching and environmental damage forced it to gradually migrate to the Russian Far East, although the environment in the Far East was worse, But being sparsely populated makes them safer.**

**in the past two years,  
due to the improvement of wildlife  
protection laws, people's awareness of  
environmental protection has gradually  
increased, and the severe crackdown on  
poachers has slowed down the number of  
Wild Amur tigers. I hope this strongest cat  
can continue.**
