# SQL SELECT

Database Systems Lecture 7
Natasha Alechina

### In this Lecture

- SQL SELECT
  - WHERE clauses
  - SELECT from multiple tables
  - JOINs
- For more information
  - Connolly and Begg Chapter 5
  - Ullman and Widom Chapter 6.1-6.3

# SQL SELECT Overview

```
SELECT
 [DISTINCT | ALL] <column-list>
 FROM <table-names>
  [WHERE <condition>]
 [ORDER BY <column-list>]
  [GROUP BY <column-list>]
  [HAVING <condition>]
                 • ([]- optional, | - or)
```

# **Example Tables**

#### Student

ID Fire	stLast	
S103	John	Smith
S104	Mary	Jones
S105	Jane	Brown
S106	Mark	Jones
S107	John	Brown

#### Course

Code	Title
	Database Systems ogramming 1 ogramming 2 o to Al

#### Grade

ID Co	de Ma	rk
S103	DBS	72
S103	IAI 58	
S104	PR168	
S104	IAI 65	
S106	PR243	
S107	PR176	
S107	PR260	
S107	IAI 35	

### DISTINCT and ALL

- Sometimes you end up with duplicate entries
- Using **DISTINCT** removes duplicates
- Using ALL retains them - this is the default

SELECT ALL Last FROM Student

Last

Smith Jones

Brown

Jones

**Brown** 

SELECT DISTINCT Last

FROM Student

Last

Smith Jones

**Brown** 

### WHERE Clauses

- Usually you don't want all the rows
  - A WHERE clause restricts the rows that are returned
  - It takes the form of a condition - only those rows that satisfy the condition are returned

- Example conditions:
  - Mark < 40
  - First = 'John'
  - First <> 'John'
  - First = Last
  - (First = 'John') AND
    (Last = 'Smith')
  - (Mark < 40) OR (Mark > 70)

# WHERE Examples

SELECT \* FROM Grade
WHERE Mark >= 60

ID Co	de Ma	rk
S103	DBS	72
S104	PR168	
S104	IAI 65	
S107	PR176	
S107	PR260	

SELECT DISTINCT ID
FROM Grade
WHERE Mark >= 60

S103 S104 S107

# WHERE Example

Given the table

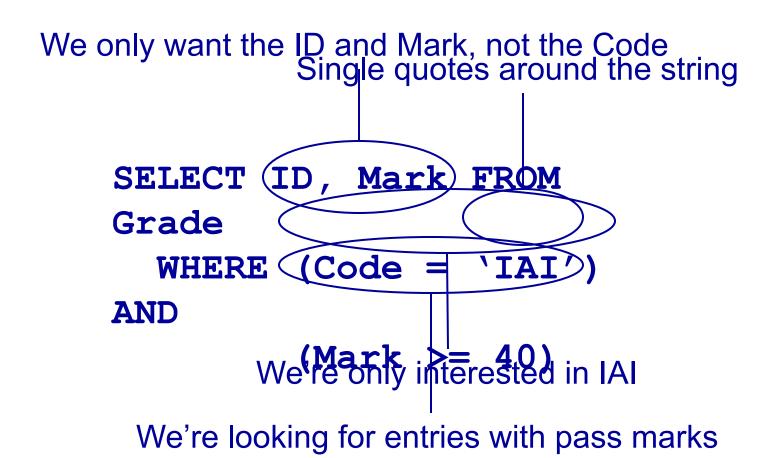

#### Grade

ID Co	de Ma	rk
S103 S103	DBS IAI 58	72
S104 S104	PR168 IAI 65	
S106	PR243	
S107 S107	PR176 PR260	
S107	IAI 35	

 Write an SQL query to find a list of the ID numbers and marks in IAI of students who have passed (scored 40 or higher) IAI

ID Ma	rk
S103	58
S104	65

### One Solution

- Often you need to combine information from two or more tables
- You can get the effect of a product by using

```
SELECT * FROM Table1,
Table2...
```

- If the tables have columns with the same name ambiguity results
- You resolve this by referencing columns with the table name

TableName.Column

#### SELECT

First, Last, Mark FROM Student, Grade WHERE

(Student.ID = Grade.ID) AND

(Mark >= 40)

#### Student

				•	
ID Fire	stLast				
S103 S104	John Mary	Smit			
S105	Jane <sup>(</sup>	Grade			
S106	Mark 1	D Co	de	Ма	rk
S107	John	S103	DF	3S	72
		S103	IA		12
	5	3104	PF	R168	
	5	S104	ΙA	l 65	
	5	S106	PF	R243	
	5	S107	PF	R176	
	5	S107	PF	R260	
		3107	IΛ	1 35	

3107

SELECT ... FROM Student, Grade

Are matched with the first entry from the Student table...

And then with the second...

and so on

	WHERE					
	ID Fire	stLastID	Code	Mark		
	S103	John	Smith	S103	DBS	72
l k	S103	John	Smith	S103	IAI 58	
	S103	John	Smith	S104	PR168	
	S103	John	Smith	S104	IAI 65	
	S103	John	Smith	S106	PR243	
	S103	John	Smith	S107	PR176	
	S103	John	Smith	S107	PR260	
	S103	John	Smith	S107	IAI 35	
	S104	Mary	Jones	S103	DBS	72
	S104	Mary	Jones	S103	IAI 58	
	S104	Mary	Jones	S104	PR168	
	S104	Mary	Jones	S104	IAI 65	
	S104	Mary	Jones			

All of the entries from the Grade table

```
SELECT ... FROM Student, Grade
WHERE (Student.ID = Grade.ID) AND
```

•	ÎD Fir	tLastID	Code	Mark		
	S103	John	Smith	S103	DBS	72
	S103	John	Smith	S103	IAI 58	
	S104	Mary	Jones	S104	PR168	
	S104	Mary	Jones	S104	IAI 65	
	S106	Mark	Jones	S106	PR243	
	S107	John	Brown	S107	PR176	
	S107	John	Brown	S107	PR260	
	S107	John	Brown	S107	IAI 35	

Student.ID

Grade.ID

```
SELECT ... FROM Student, Grade
WHERE (Student.ID = Grade.ID) AND (Mark >=
40)
```

ID Fir	stLastID	Code	Mark		
S103	John	Smith	\$103	DBS	72
S103	John	Smith	\$103	IAI 58	
S104	Mary	Jones	\$104	PR168	
S104	Mary	Jones	\$104	IAI 65	
S106	Mark	Jones	\$106	PR243	
S107	John	Brown	\$107	PR176	
S107	John	Brown	\$107	PR260	

SELECT First, Last, Mark FROM Student, Grade
WHERE (Student.ID = Grade.ID) AND (Mark >=
40)

FirstLas		
John John Mary Mary Mark John John	Smith Smith Jones Jones Jones Brown Brown	72 58 68 65 43 76 60

 When selecting from multiple tables you almost always use a where clause to find entries with common values

```
SELECT * FROM
   Student, Grade,
   Course
WHERE
   Student.ID = Grade.ID
AND
   Course.Code =
   Grade.Code
```

Student	Grade	Course

ID Firs	tLastID	Code	Mark	Code	Title		
S103	John	Smith	S103	DBS	72 DBS	S Dat	abase Systems
S103	John	<b>Smith</b>	S103	IAI 58	IAI Intro	to Al	
S104	Mary	Jones	S104	PR168	PR1Pro	gramming	<b>1</b>
S104	Mary	Jones	S104	IAI 65	IAI Intro	to Al	
S106	Mark	Jones	S106	PR243	PR2Pro	gramming	2
S107	John	Brown	S107	PR176	PR1Pro	grammin	<b>1</b>
S107	John	Brown	S107	PR260	PR2Pro	gramming	2
S107	John	Brown	S107	IAI 35	IAI Intro	to AI	

Student.ID = Grade.ID

Course.Code = Grade.Code

### **JOINs**

- JOINs can be used to combine tables
  - There are many types of JOIN
    - CROSS JOIN
    - INNER JOIN
    - NATURAL JOIN
    - OUTER JOIN
  - OUTER JOINS are linked with NULLs more later

#### A CROSS JOIN B

 returns all pairs of rows from A and B

#### A NATURAL JOIN B

 returns pairs of rows with common values for identically named columns and without duplicating columns

#### A INNER JOIN B

 returns pairs of rows satisfying a condition

## **CROSS JOIN**

#### Student

ID I	Va	ame
123	Jc	hn
124 I	VI	ary
125 I		
126	Ja	ne

#### **Enrolment**

ID Co	ode
123 DI	
124 PF	
124 DI	BS
126 PF	RG

# SELECT \* FROM Student CROSS JOIN Enrolment

ID	Name	ID	Code	
123	John 123	DB	S	
124	Mary123	DB	S	
125	Mark123	DB	S	
126	Jane 123	DB	S	
123	John 124	PR	G	
124	Mary124	PR	G	
125	Mark124	PR	G	
126	Jane 124	PR	G	
123	John 124	DB	S	
124	Mary 124			

### **NATURAL JOIN**

#### Student

ID Na	ame
123 Jo	
124 M	ary
125 M	ark
126 Ja	ne

#### **Enrolment**

ID Co	ode
123 DI	BS
124 PF	RG
124 DI	BS
126 PF	RG

#### SELECT \* FROM

# Student NATURAL JOIN Enrolment

ID Na	ame	Code
123 Jo	hn	DBS
124 M	ary	PRG
124 M	ary	DBS
126 Ja	ne	PRG

### CROSS and NATURAL JOIN

```
SELECT * FROM
A CROSS JOIN B
```

is the same as

```
SELECT * FROM A, B
```

```
SELECT * FROM
A NATURAL JOIN B
```

is the same as

```
SELECT A.col1,... A.coln,
    [and all other columns
    apart from
    B.col1,...B.coln]
FROM A, B
WHERE A.col1 = B.col1
    AND A.col2 = B.col2
...AND A.coln = B.col.n
(this assumes that col1...
    coln in A and B have
    common names)
```

INNER JOINS specify a • Can also use condition which the pairs of rows satisfy

SELECT \* FROM TIMER JOIN

```
SELECT * FROM

A INNER JOIN B

ON <condition>
```

Can also use
 SELECT \* FROM
 A INNER JOIN B
 USING
 (col1, col2,...)

 Chooses rows where the given columns are equal

#### Student

ID Na	ame
123 Jo	
124 M	ary
125 M	
126 Ja	ne

#### **Enrolment**

ID C	ode
123 D	T
124 P	RG
124 D	BS
126 P	RG

#### SELECT \* FROM

Student INNER JOIN Enrolment USING (ID)

ID	Name	ID	Code	
124 124	John Mary Mary Jane	124 124	B DBS 4 PRG 4 DBS 6 PRG	

#### Buyer

Name	Budget		
Smith	100,000		
Jones	150,000		
Green	80,000		

#### **Property**

Address	Pri	ce
15 High St		5,000
12 Queen St	12	5,000
87 Oak Row	17	5,000

#### SELECT \* FROM

Buyer INNER JOIN
Property ON
Price <= Budget</pre>

Name	Budget	Address	Pric	e
Smith		15 High St		
Jones		15 High St		
Jones	150,000	12 Queen S	t	125,000

```
SELECT * FROM

A INNER JOIN B

ON <condition>
```

• is the same as

```
SELECT * FROM A, B
WHERE <condition>
```

```
SELECT * FROM

A INNER JOIN B

USING(col1, col2,...)
```

is the same as

```
SELECT * FROM A, B
WHERE A.col1 = B.col1
AND A.col2 = B.col2
AND ...
```

### JOINs vs WHERE Clauses

- JOINs (so far) are not needed
  - You can have the same effect by selecting from multiple tables with an appropriate WHERE clause
  - So should you use JOINs or not?

- Yes, because
  - They often lead to concise queries
  - NATURAL JOINs are very common
- No, because
  - Support for JOINs varies a fair bit among SQL dialects

# Writing Queries

- When writing queries
  - There are often many ways to write the query
  - You should worry about being correct, clear, and concise in that order
  - Don't worry about being clever or efficient

- Most DBMSs have query optimisers
  - These take a user's query and figure out how to efficiently execute it
  - A simple query is easier to optimise
  - We'll look at some ways to improve efficiency later
