

A wide-angle photograph of a geothermal landscape in Yellowstone National Park. In the center, a large, circular geothermal spring, known as the Grand Prismatic Spring, is in full view. The water in the spring is a vibrant, multi-colored blue, transitioning to green and yellow at the edges, surrounded by mineral-rich, orange and brown terraces. A thick plume of white steam rises from the center of the spring, drifting towards the right. The surrounding terrain is a mix of light-colored, mineral-laden rocks and patches of green and yellow vegetation. In the background, a dense forest of evergreen trees stretches across the valley, with rolling hills and mountains visible under a blue sky with scattered white clouds. The overall scene is a classic representation of the geothermal activity in Yellowstone.
