

Bears

The bear is the largest predator on earth. This animal belongs to the class of mammals, the order of carnivores, the family of bears, the genus bears (*Ursus*). The bear appeared on the planet about 6 million years ago.

Bears are very fast and agile-the speed of a bear chasing prey or in moments of danger can reach up to 50 km per hour.

And bears are not only excellent runners, but also no less good swimmers, they swim perfectly, and polar bears even have special webbing between their paws, all for the convenience of swimming.

The mating season in bears can occur at different times (depending on the species), but what is interesting is that the bears always give birth to their cubs in winter, right during hibernation and come out of the den with the cubs.
