Внешние модули

- Модули надо установить в текущее окружение
- Подключить к программе

- Среда PyCharm предлагает СНАЧАЛА подключить модуль
- Затем, если его нет в окружении – докачать через Интернет и установить

- После скачивания среда тратит время на анализ модуля, это требует времени

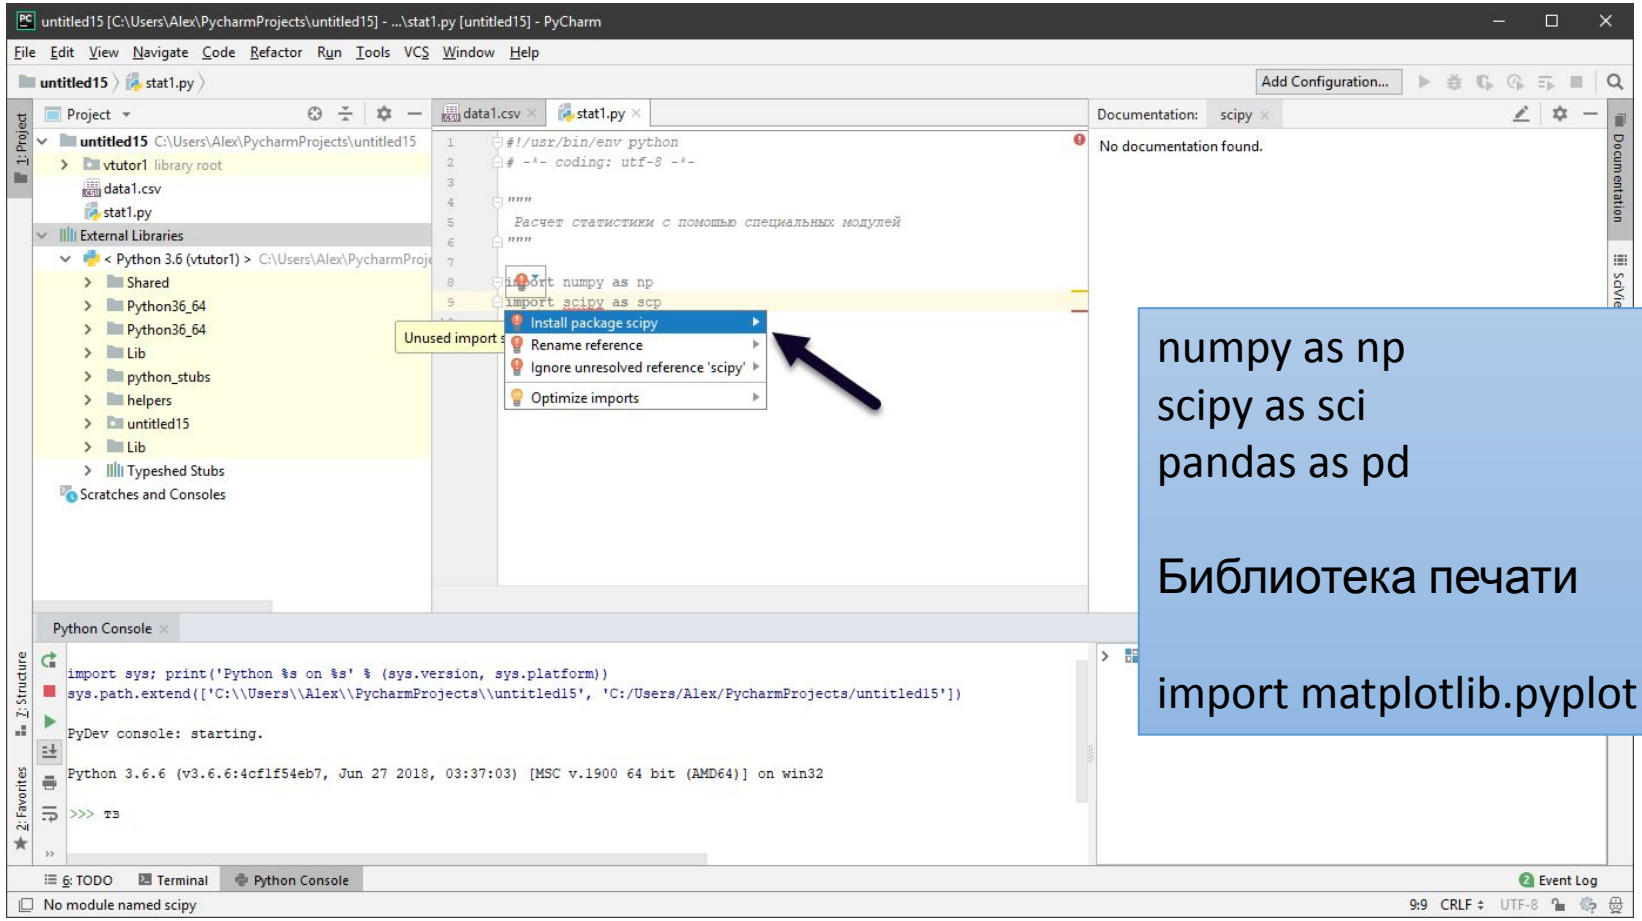
Добавьте (загрузите модули при необходимости)

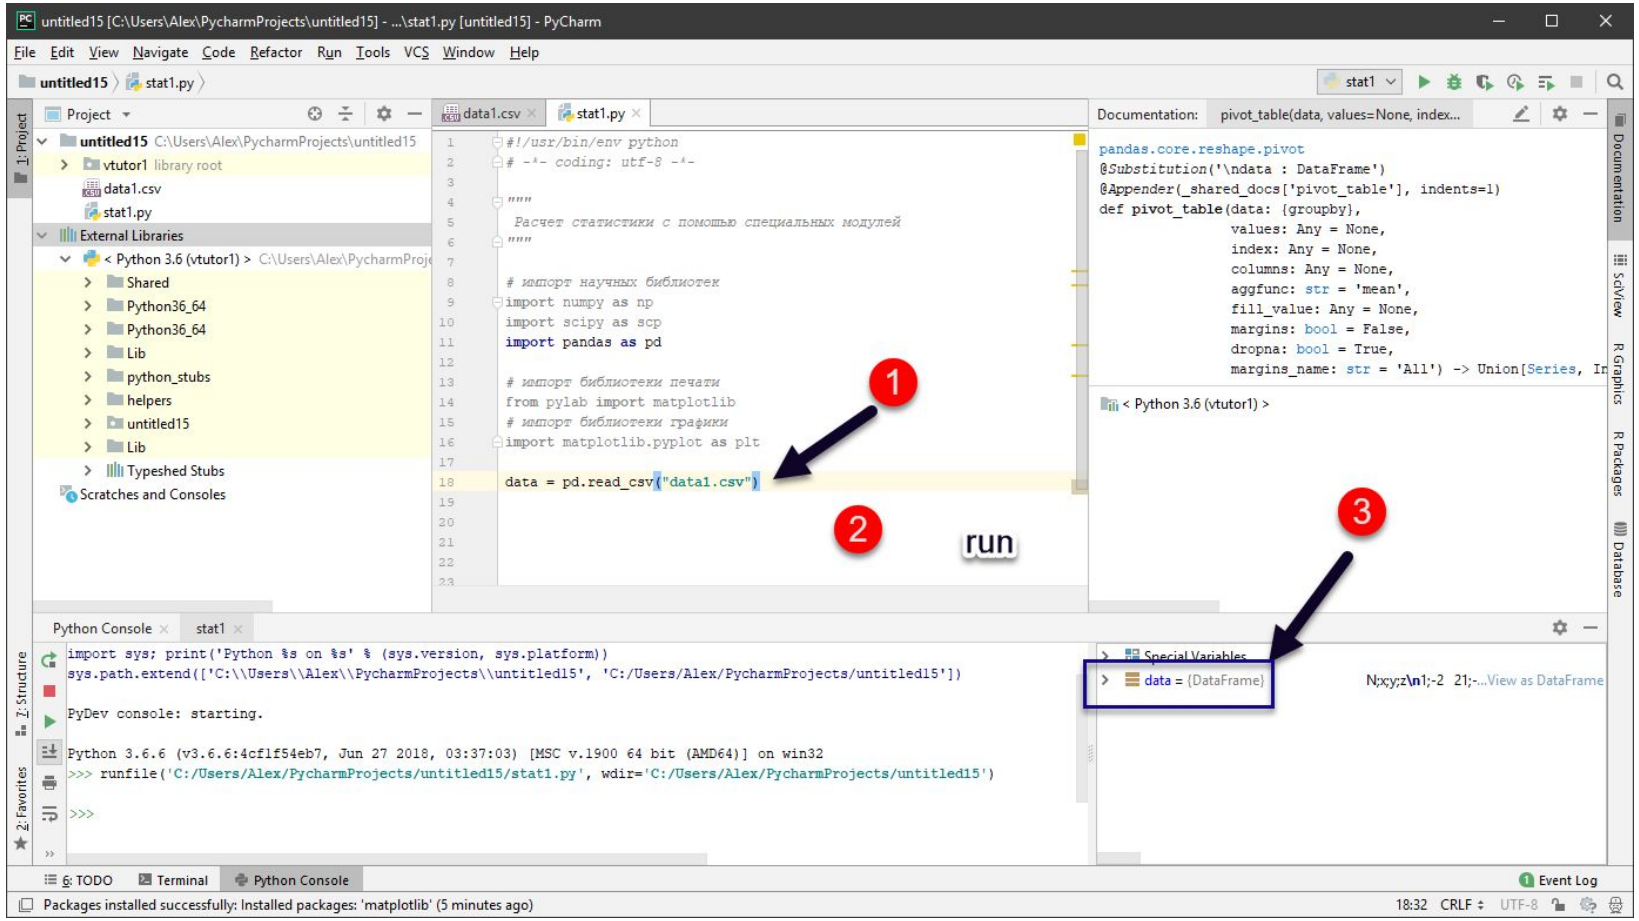


numpy as np
scipy as sci
pandas as pd

Библиотека печати

import matplotlib.pyplot as plt

Чтение данных



Что неверно?

- Разделитель – точка с запятой
- Десятичная точка – запятая

- Лучше так
- data = pd.read_csv("data1.csv",sep=";",decimal=",")

- Такая структура, как фрейм данных pandas является близким аналогом фрейма из языка R
- В частности, он сам «знает» что и как надо напечатать
- Фрейм состоит из переменных (колонок), и строк
- Существуют механизмы выбора отдельных колонок или их множества
- Существуют инструменты отбора данных в колонках (например по условию)
- Потенциально существует возможность поменять местами строки и столбцы (транспонировать таблицу)
