

Методы модуля Random

6 самых важных для решения
домашних задач

Choice : Choose a random element
from a non-empty sequence.

If the relative weights or
cumulative weights are not
specified,
the selections are made with
equal probability.

Randint : Return random integer in range $[a, b]$, including both end points.

This fixes the problem with `randint()` which includes the endpoint; in Python this is usually not what you want.

Random : `random()` \rightarrow x in the interval $[0, 1)$.

into grand prize and second place winners (the subslices).

Members of the population need not be hashable or unique. If the population contains repeats, then each occurrence is a possible selection in the sample.

To choose a sample in a range
