The background is a high-contrast, blue-tinted photograph of water in motion. The top half shows a turbulent splash with white highlights against a dark blue background. The bottom half is filled with a dense cloud of small, dark bubbles rising from below. Overlaid on this image is a white text block.

One of the main environmental problems is water pollution. This is exactly what will be discussed.

The surface of the earth is 75% water. Thanks
to it on our planet there is life
Water is important for living organisms for two
reasons:

The first reason

Water is an essential component of living cells.
It underlies many of the processes that occur
in living organisms.

The second reason

For many organisms it also serves as a habitat. For example, you can take fish. From water, with the help gills, they receive oxygen for enrichment them blood.

A high-speed photograph of water being poured, creating a dynamic splash with many bubbles and droplets. The water is a deep blue color, and the background is a lighter blue gradient. The text is overlaid on the lower half of the image.

But due to human and natural factors water can become uninhabitable. The consequences of water pollution lead to imbalance in the ecosystem, the development of diseases and death of representatives of the biosphere. As a result the fish begins to die.

Water pollution is a serious problem of mankind,
but water can still be saved. First of all you
need to learn to take care of natural resources
