Paper title

THE EFFECT OF HYPOXIA AND ANTIORTHOSTASIS ON NEUROPHYSIOLOGICAL PARAMETERS OF VOLUNTARY AND EXOSKELETON MOVEMENT

Paper abstract

[Don't have an abstract?](#) 

The study results of the possible hypoxia and antiorthostatic hypokinesia modulating influence on motoneuron pool activity are presented in the paper. Soleus and gastrocnemius muscles with voluntary and passive movement in the exoskeleton. The unidirectional conditioning of the monosynaptic spinal H-reflex was revealed under non-specific hypoxia and antiorthostasis effects. Also, after stressful effects, there was a pronounced decrease in the H-reflex depression, which is apparently due to the weakening effect of suprasegmental control systems in the cumulative effect of hypoxic hypoxia and antiorthostatic hypokinesia.
