

# GASTRITIS

# Схема желудка

# What is it?

- Chronic gastritis , by definition, is a histopathological entity characterized by chronic inflammation of the stomach mucosa that reason- helicobacter-pillory.

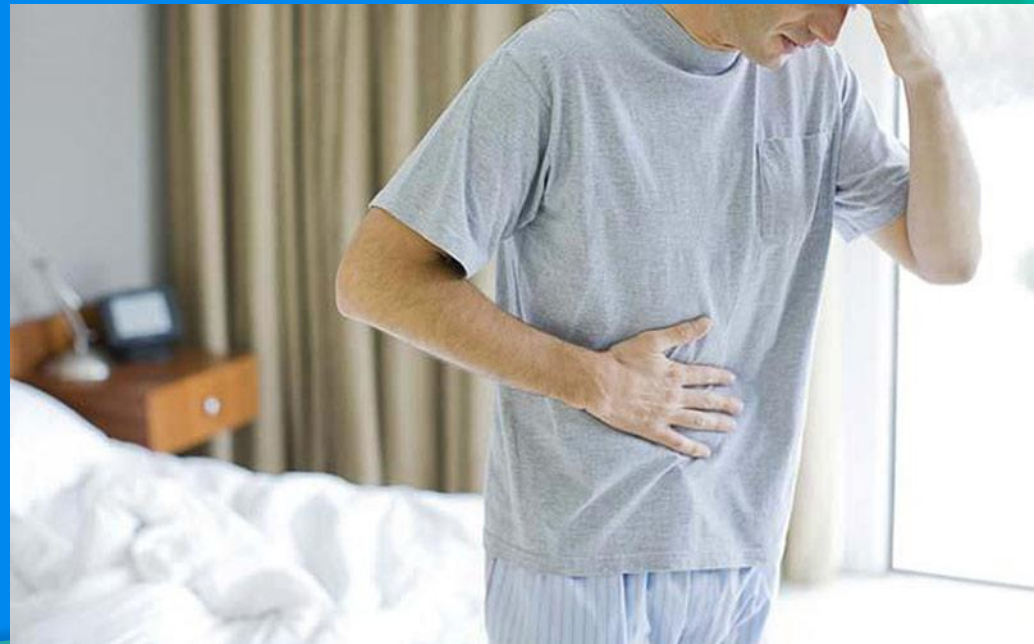

*Helicobacter pylori*

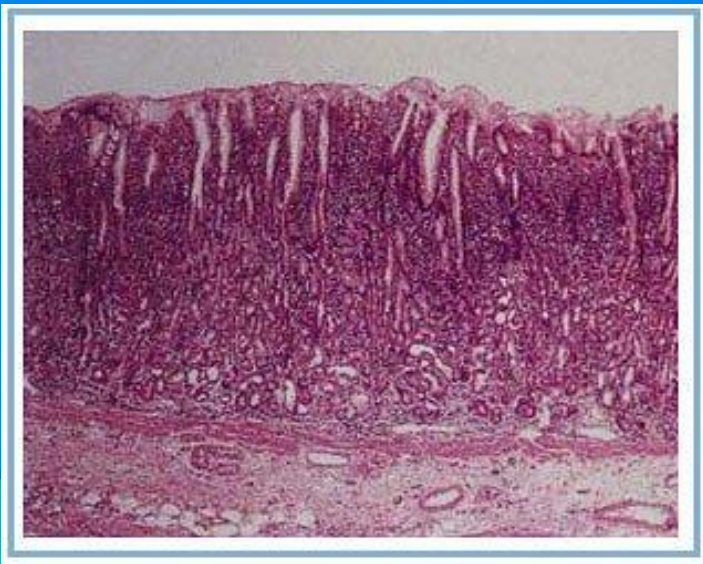

# Gastritis you feel pain in the abdomen. Why?

- cells of the damaged stomach mucosa proliferate fast and shall quickly as a result the cellular layer becomes «younger».that cells are functionality defective and have no time to form their secretory protective and properties

That's why chronic gastritis is a problem of disregeneration, not inflammation.

- In other words, gastritis(in spite of the word's ending being «inflammatory suffix R-itis).I shouldn't be treated with anti inflammatory medicines

- However, any student, which is acquainted with pharmacology understands impossibility to prescribe anti-inflammatory medicines(steroid or non-steroid) in case of gastritis, because prednolone and aspirin are powerful ulcerogenic agents

# key point

- *Helicobacter pylori* associated chronic gastritis is of infectious etiology, and, consequently etiological therapy is necessary. Thus, chronic gastritis should be treated by antibiotics.
