

# WHO LIVES

**Matvey Shedrin's work.**

# Leo

Leo living in the wild up to 10 years and in the zoo 20 years.

# elephant

Life expectancy of elephants is dependent on many factors. On average, the giants live to 70 years.

Herpetologists (specialists who study reptiles) from all over the world celebrate the direct relationship between the size of the snake, and the duration of its life. On average, the small size of the snake, snakes for example, live 10 to 15 years, but the pythons have lived much longer, from 25 to 30 years, although unconfirmed reports, some individuals can live for half a century.
