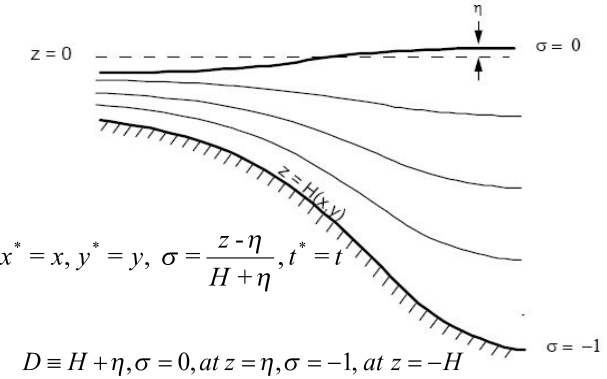
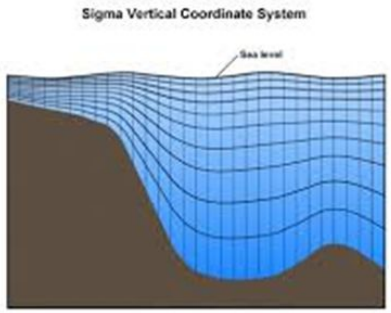
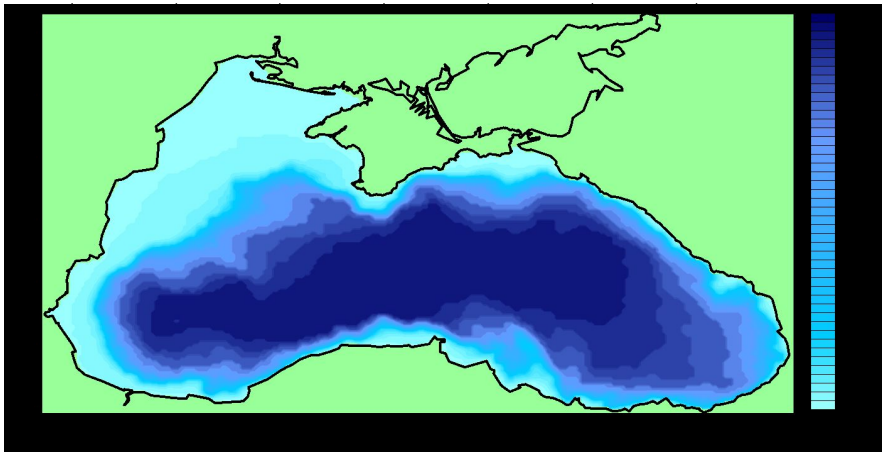
Гидродинамическая модель макета системы диагноза-прогноза Черного моря

В основе макета системы диагноза и прогноза динамики Черного моря лежит модель циркуляции с фиксированным пространственным разрешением, созданная на базе модели циркуляции Принстонского университета – POM (The Princeton Ocean Model).

- Аппроксимация традиционной примитивной системы уравнений на сетке C;
- Горизонтальное пространственное разрешение: dx=dy=4.8 км (236x130 узлов сетки);
- 36 σ-уровней по вертикали, сгущающихся к морской поверхности;
- Использование алгоритма разделения по модам (бароклинной и баротропной);
- Параметризация вертикального турбулентного перемешивания с помощью встроенной модели турбулентности Меллора-Ямады;
- Задаются среднемесячные климатические значения расходов в устьях рек и проливов.







Область интегрирования модели

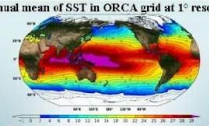
The Nucleus for European Modelling of the Ocean – NEMO

The NEMO System Team*

The Nucleus of European Modelling of the Ocean (NEMO) is a state-of-the-art modelling framework for oceanographic research, operational oceanography, seasonal forecast and climate studies. NEMO includes 5 major components: the blue ocean (ocean dynamics, NEMO-OPA); the white ocean (sea-ice, NEMO-LIM); the green ocean (biogeochemistry, NEMO-TOP); the adaptive mesh refinement software (AGRIF) and the assimilation component (NEMO-TAM). Some reference configurations allowing to set-up and validate the applications and a set of scripts and tools (the "environment") to use the system are also available to the users community. The evolution and reliability of NEMO are organised and controlled by a European Consortium between CNRS (France), Mercator-Ocean (France), NERC (UK), UKMO (UK), CMCC (Italy) and INGV (Italy). NEMO evolves through the improvement of the existing components, the creation of new components, and the improvement and generalization of the "environment". As improvements are validated, they are implemented in the shared references, in order to ensure the reliability of the system, to allow projects to find the appropriate version and to keep track of the evolutions.

ORCA-LIM Reference Configuration

Annual mean of SST in ORCA grid at 1° resolution



The ORCA family is a series of global ocean configurations that are run together with the LIM sea-ice model, using various resolutions from 2° to 1/12°. Only the ORCA2 is provided with all its input files. This version of ORCA2 has 31 levels in the vertical, with the highest resolution (10m) in the upper 150m.

OPA

is a primitive equation model (Arakawa-C) for regional and global ocean circulation (z-, s-levels or hybrid). It is a flexible tool for studying ocean and its interactions with the others earth system components over a wide range of spatial and temporal scales. Various physical choices are available to describe ocean physics (vertical / horizontal mixing, barotropic EGWs, momentum and tracers advection, momentum equations, BBL schemes, Filtered, Time-splitting, explicit, Solar penetration, Surface Forcing, Tides, Flexible LOBC treatments, Vertical Physics).

AGRIF

The adaptive mesh refinement software

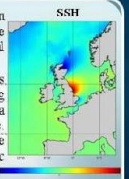
NEMO module to perform two-way nested simulation. It creates the grid coordinates, the surface forcing and the initial conditions required by each child model. It sets-up MPP configuration tool and manages the communications during the run.

AAM Reference Configuration

AMM12 configuration gives an example of the use of NEMO for coastal forecasting.

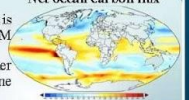
The configuration uses stretched terrain following coordinates along with a non-linear free surface. Open boundaries provide barotropic and baroclinic data and tidal forcing.

The Configuration uses time-splitting enabling it to efficiently resolve the tides. The instantaneous SSH signal, dominated by the tides, is shown in the plot on the right.



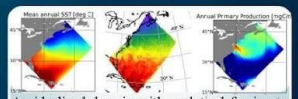
ORCA-PISCES Reference Configuration

Net ocean carbon flux



ORCA-PISCES is the ORCA-LIM configuration coupled either online or offline with PISCES biogeochemical model. PISCES simulates the lower marin ecosystem trophic levels (phyto / microzoo / mesozooplankton) and the biogeochemical cycles of carbon and main nutrients (P, N, Fe, and Si). The model is intended to be used for both regional and global configurations at high or low spatial resolutions as well as for short and long-term analyses

GYRE-TOP Reference Configuration



An idealized domain with analytical forcing to simulate the seasonal cycle of a double-gyre dynamic, coupled or not with a biogeochemical model. The standard configuration is a β-plane with regular 1° horizontal resolution. The flexibility of the configuration allows the user to modify it by changing a few parameters. This allows to investigate the generation of a large number of interacting, transient eddies and their contribution to the large scale circulation.

TOP

the passive tracer package includes a transport component and a coupling framework with the distributed PISCES biogeochemical model or external models like the BFM (http://bfm-community.eu), as well as more simple tracer models for CFC and Bomb C14.

TAM

Tangent and Adjoin Model

It is the Tangent and Adjoint Model of the ocean dynamic part (OPA). TAM will not released with every NEMO version.

LIM

LIM3

the latest version of the Louvain-la-Neuve sea-ice model including a new thermodynamics (Vancoppenolle *et al.* Ocean Modelling 2008) and a C-grid Elasto-Visco-Plastic rheology.

The NEMO System Team

The ***NEMO System Team*** is in charge of the shared NEMO reference and its evolutions. The members of this team are the experts on the NEMO system. The System Team:
-ensures the user support on the NEMO reference and the reference configurations;
-ensures the sustainable development of NEMO;
-carries out the agreed plan and schedule of work approved by the steering committee.

- Incorporation into NEMO of new developments (scientific or technical)
- Re-organization of code to improve its readability, orthogonality or structure
- Optimization of NEMO on the computers available in the consortium
- Maintenance of the paper and on-line documentation
- Configuration control of the available versions of NEMO
- Testing and release of new versions (typically once or twice a year)
- Making NEMO readily available to the scientific community
- Providing assistance to users
- Support for user meetings (held typically once a year)
- Assistance in scientific development in an area of high priority

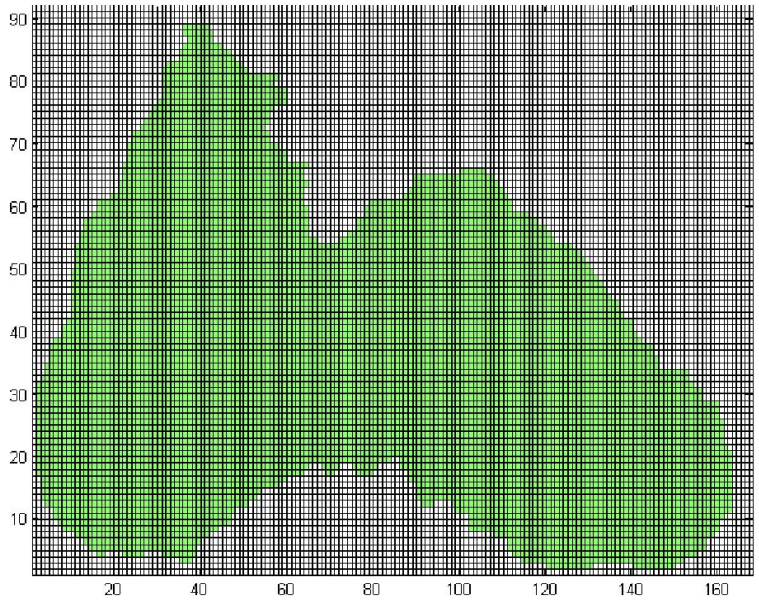
MODEL SET-UP

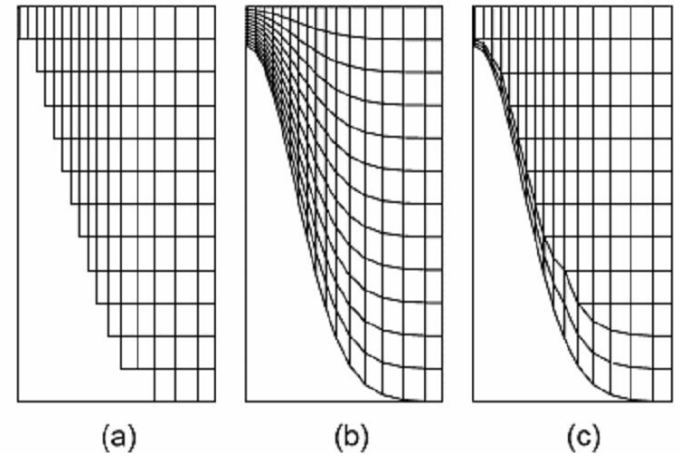
NEMO: 3-D, Baroclinic, hydrostatic, Arakawa C grid.

Model domain:
Lat : from 41 to 46.7 °N ; Long: from 28 to 42 °E
Bathymetry: ETOPO 5' slightly smoothed / corrected
Horizontal Resolution:

BLS-24: 1/24° x 1/24° ~ 4.6 x 3.5 km
Vertical resolution: 33 vertical levels (various discretization schemes)
Lateral boundaries: rivers and Bosphorous (in-out), monthly data
Forcing:
6h re-analysis data (8 parameters): Wind (U,V), SL pressure, SL air temperature, SL specific humidity, precipitation, Long wave radiation, Short wave radiation
[sources: NCEP, (low-res), DFS5.2 (low-res), SKIRION (high res)]



VERTICAL GRIDS



Standard vertical grids in NEMO:
z-level (a) ,
sigma/s-level (b) ,
z-on-top-of-sigma (c)
