

Wild cats

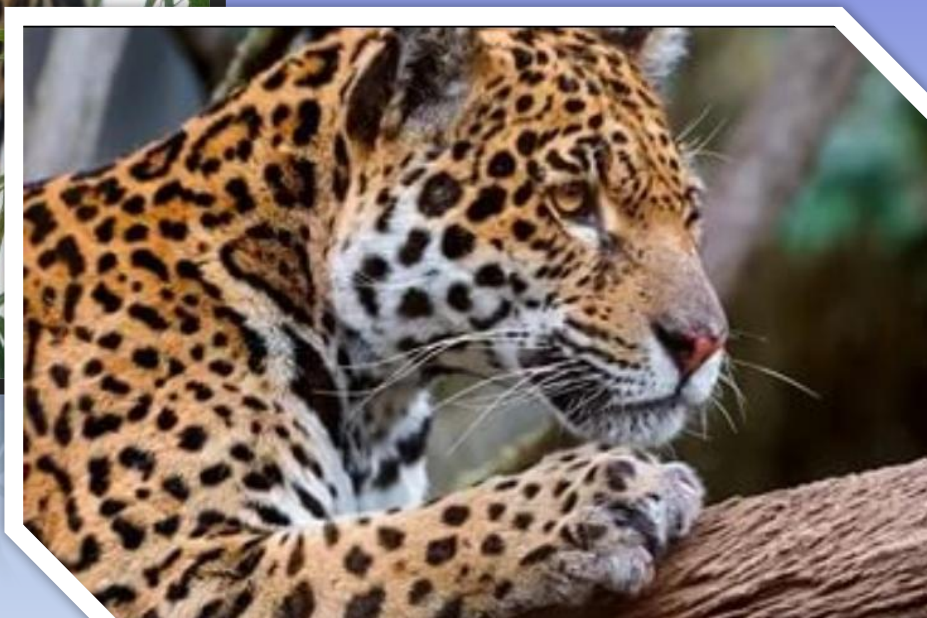

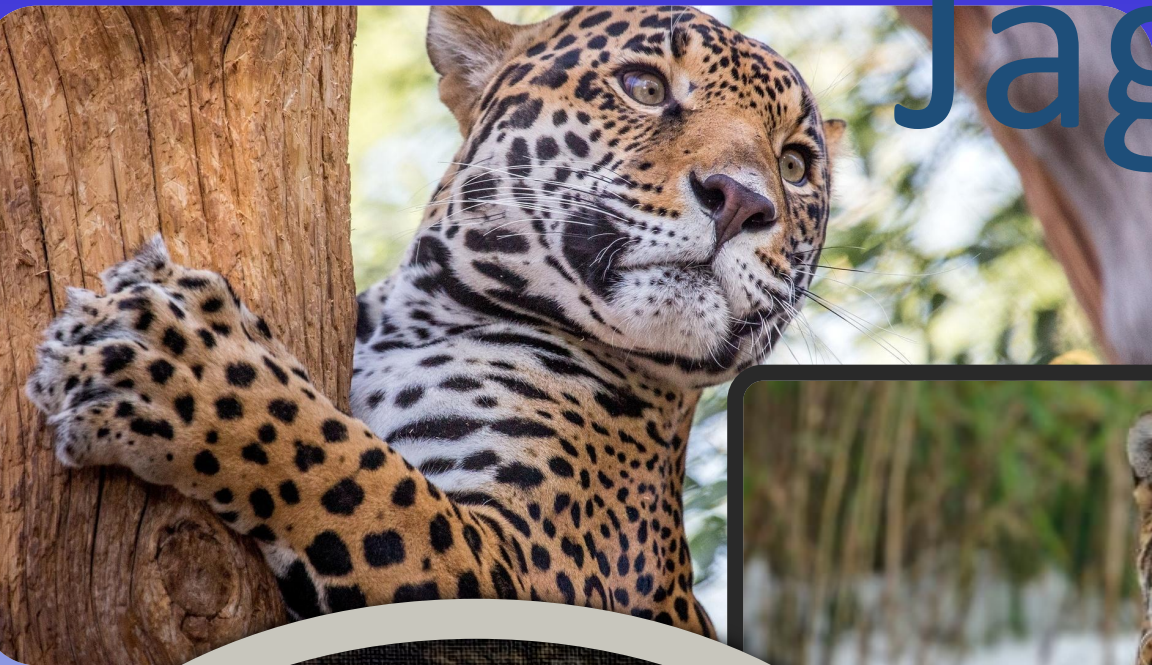

What is the difference between cheetahs, leopards and jaguars

Part 1

Jaguar

The jaguar is one of the strongest predators the third largest in world. Jaguar body length without tail is 120 – 185 cm, tail length is 45 – 75 cm, the animal weighs from 36 to 113 kg, on average it's weight is 60-90 kg. Externally the jaguar can be compared to a leopard. The body of the jaguar is massive and the tail and legs are shorter than those of the leopard. The female is 20 % smaller and lighter than the males.

Female

Males

The main habitats of the jaguar are tropical rain forests ,
grasslands - although the animal is found in other areas.

Tropical rain forest
